*EFGS workshop, Tallinn, 6 October 2010*

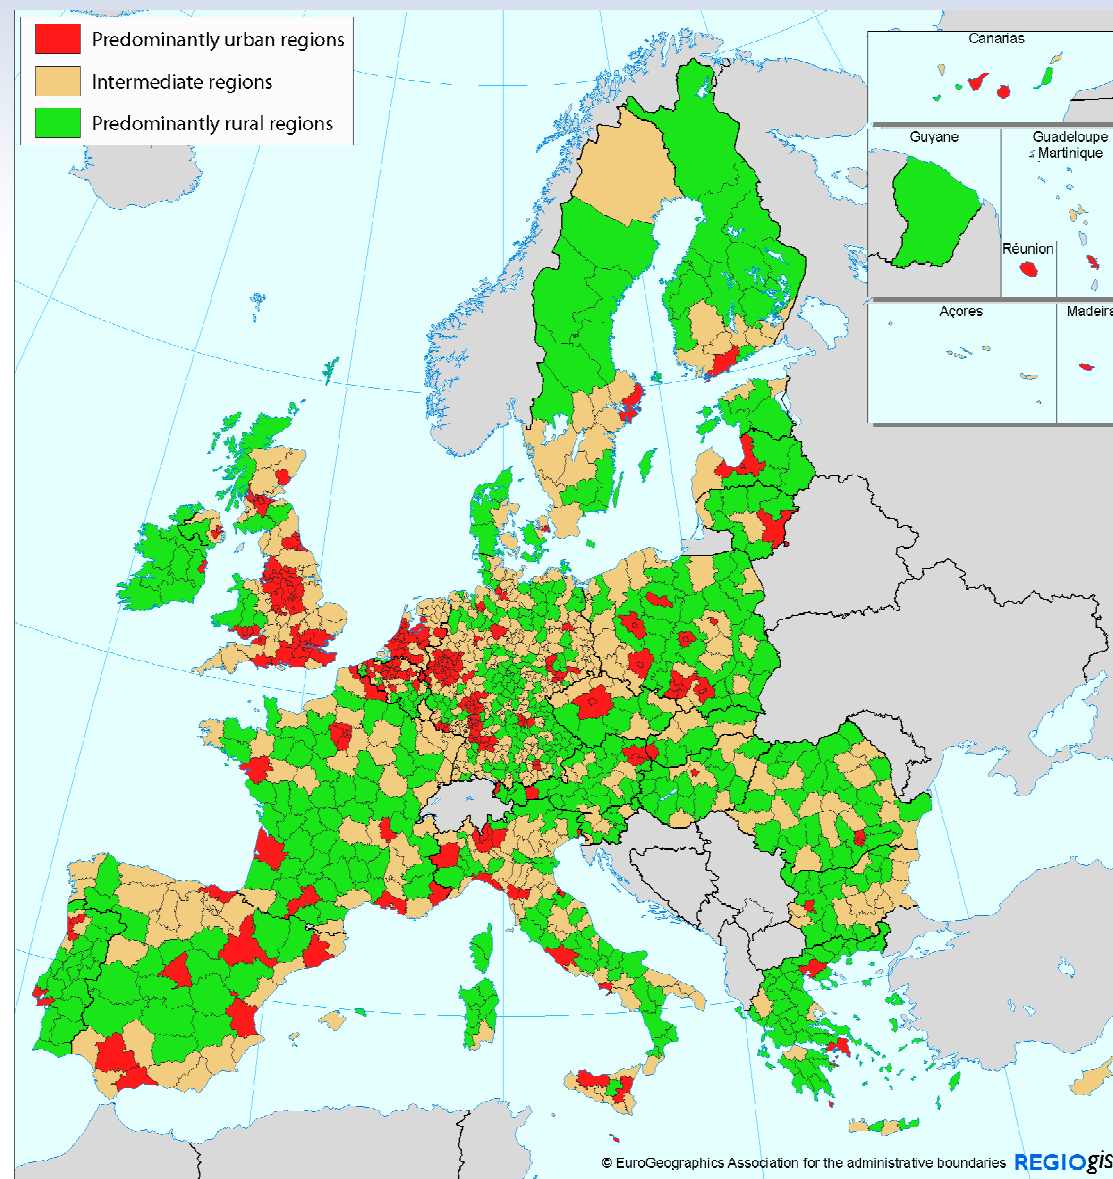

# A new typology

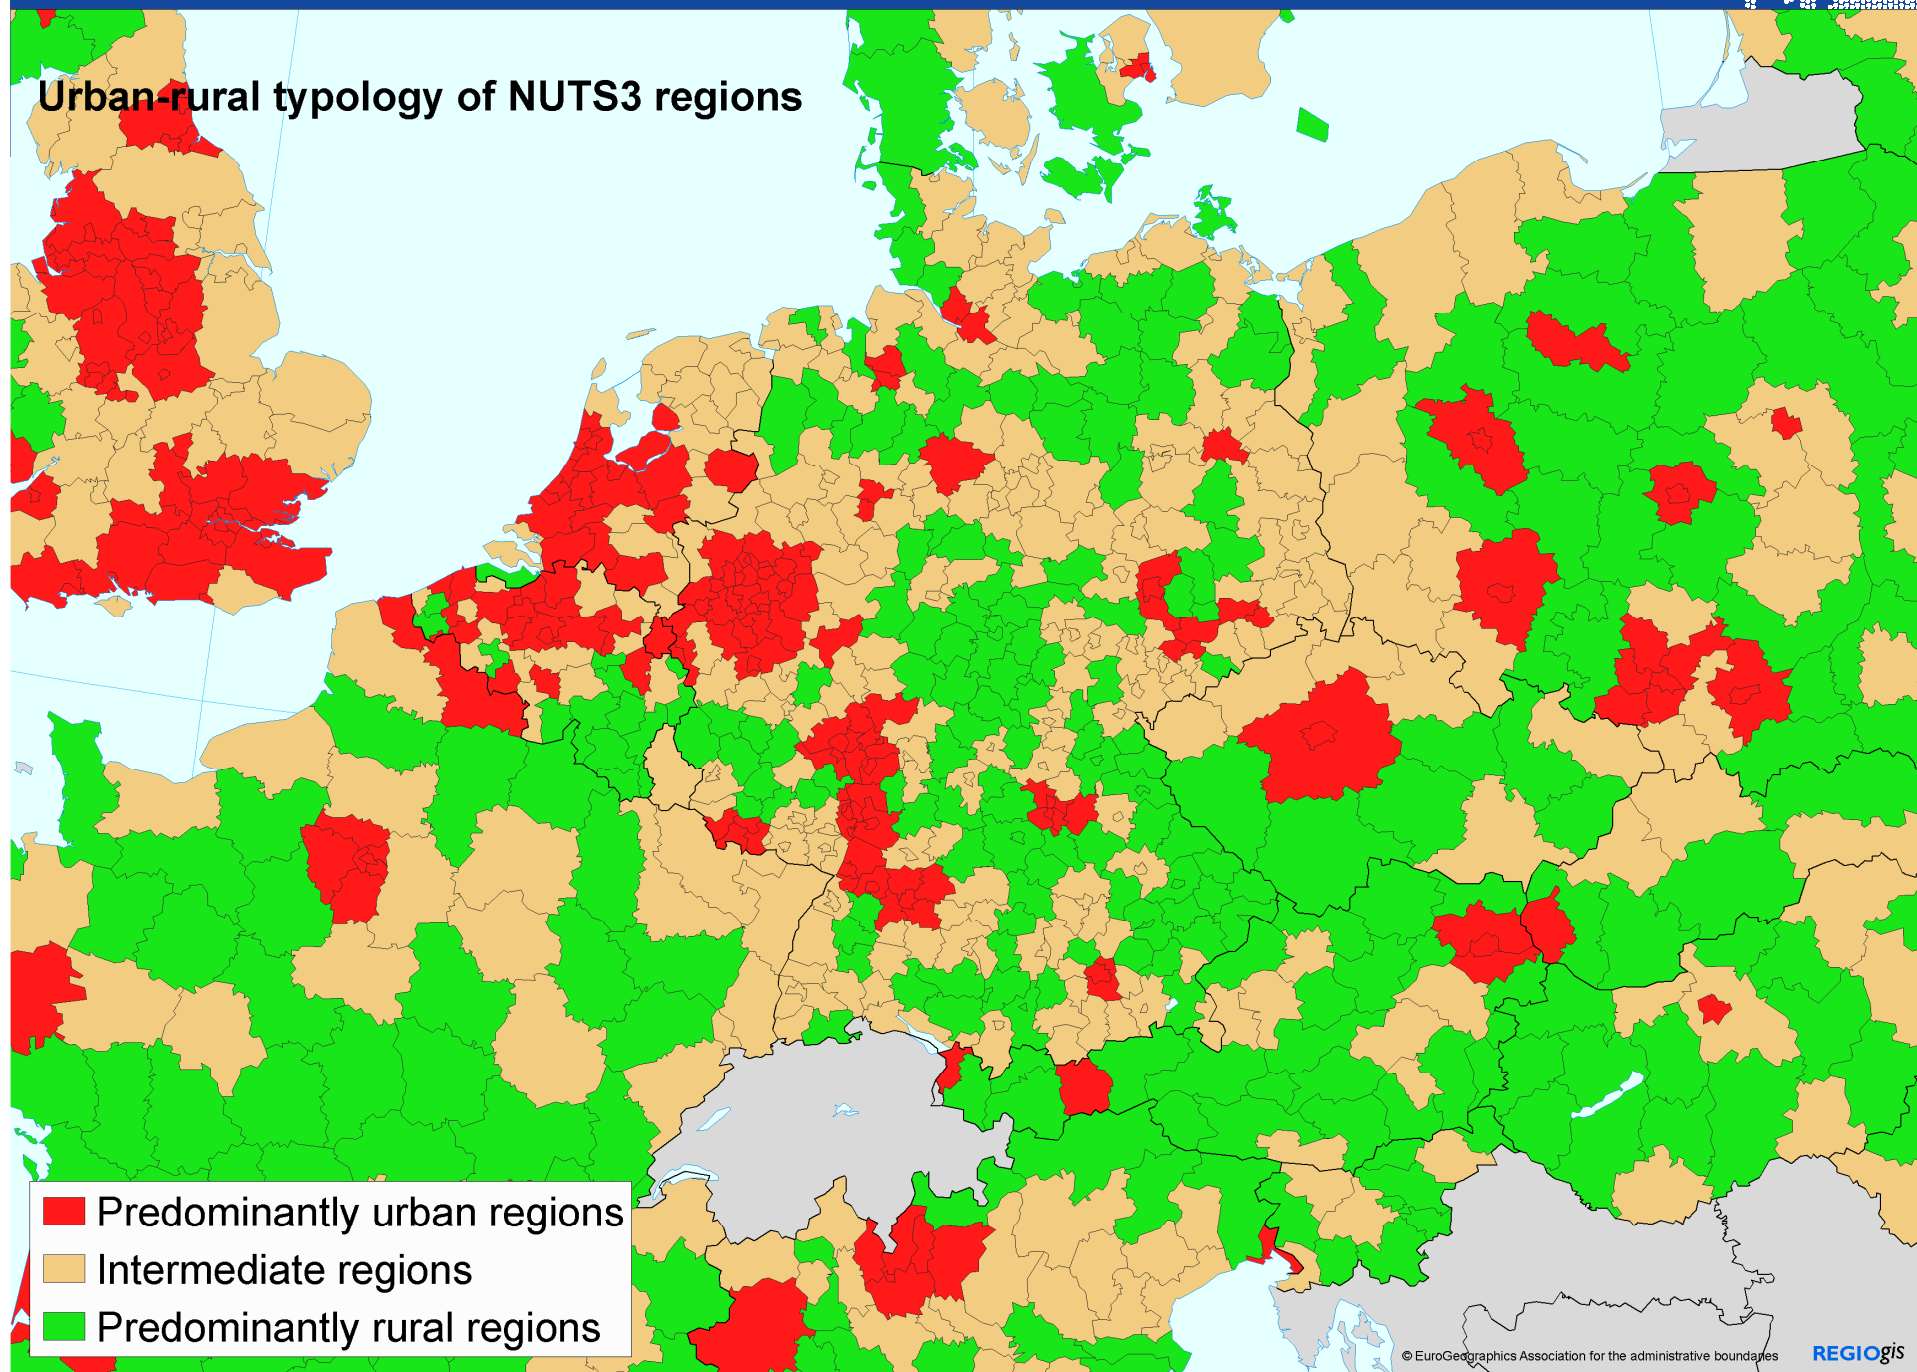

- Classifying EU NUTS3 regions
- A variant of the OECD methodology
- Aiming to provide a consistent basis for describing urban, intermediate and rural regions in various Commission reports and publications
- Developed by:
  - DG Agriculture and Rural Development
  - DG Regional Policy
  - Eurostat
  - DG Joint Research Centre

## Urban-rural typology of NUTS3 regions

## Urban-rural typology of NUTS3 regions

# Why a new typology?

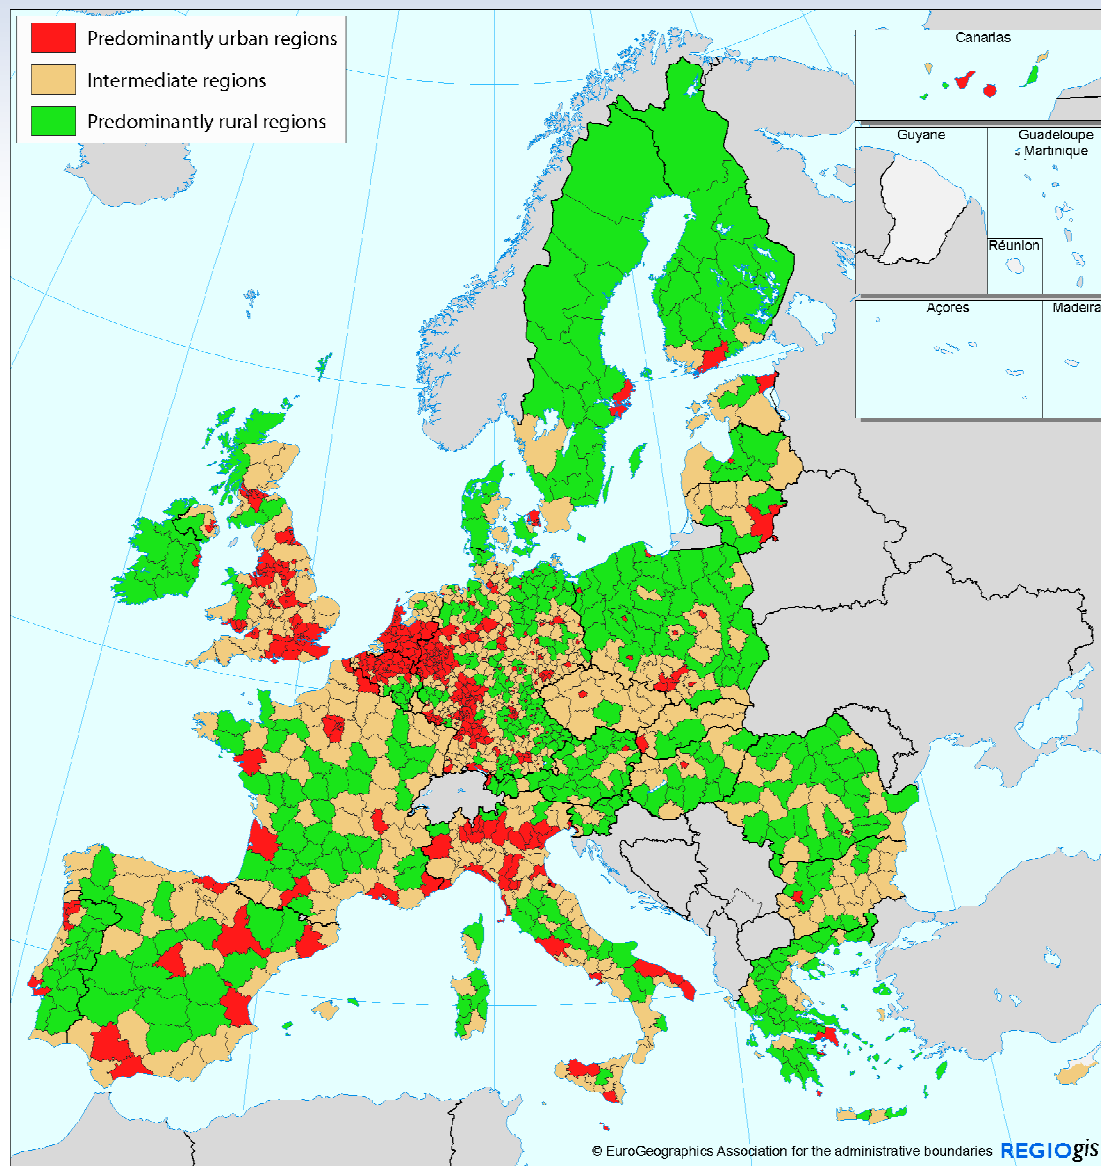

- Distortions using the OECD methodology at NUTS3 level
  - Large variation in area of local administrative units (LAU2)
  - Large variation in area of NUTS3 regions
  - Some city centres separated from surroundings, at NUTS3 level

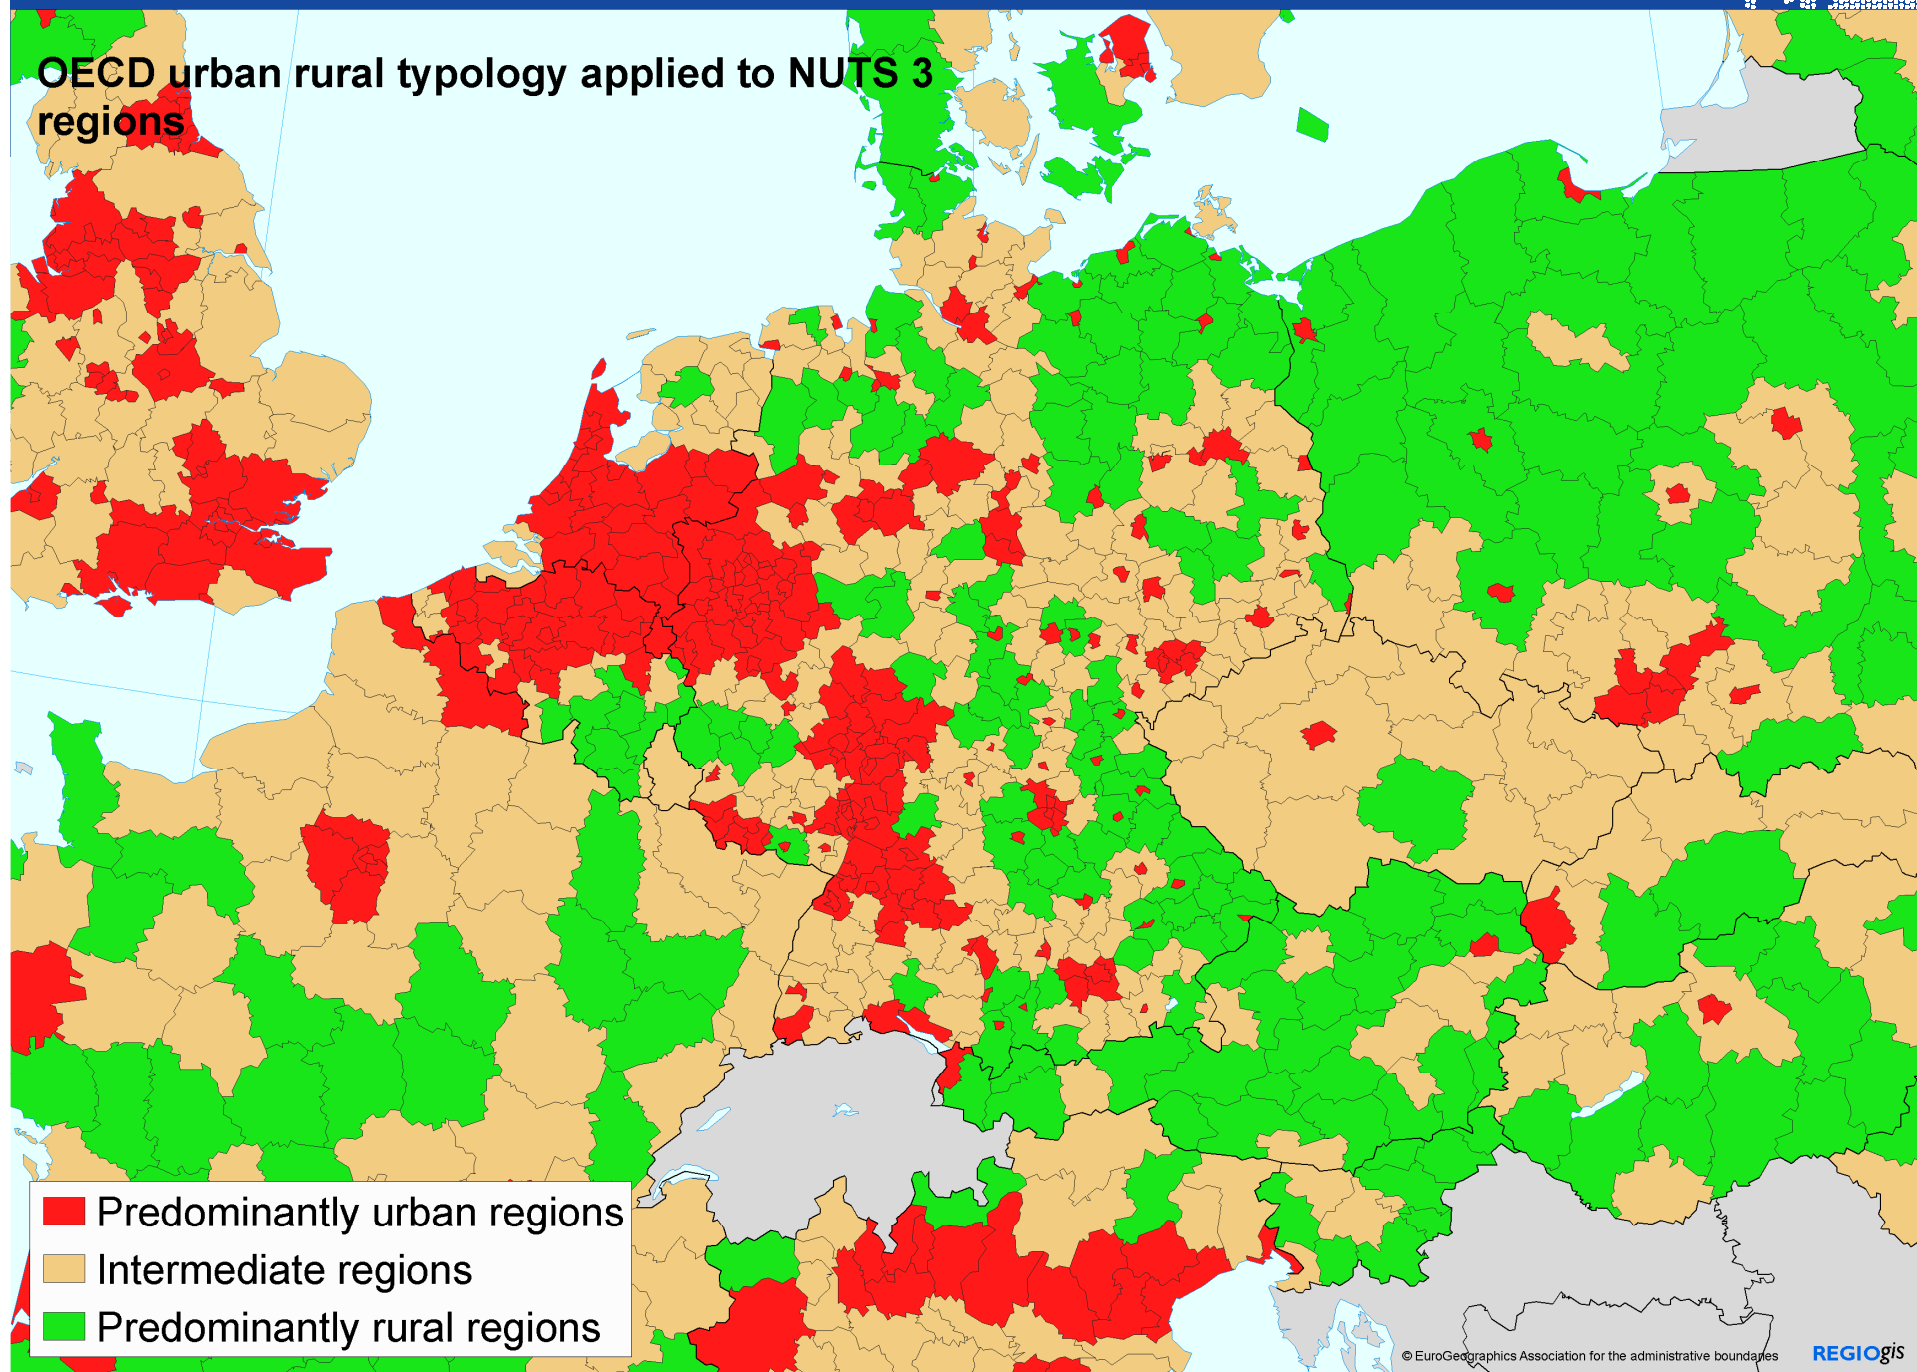

# The OECD methodology

- Local level: LAU2 with density  $< 150$  inh./km<sup>2</sup> is rural
- Regional level: NUTS3:
  - Predominantly urban: population share of rural LAU2  $< 15\%$
  - Intermediate: population share of rural LAU2 between 15% and 50%
  - Predominantly rural: population share of rural LAU2  $> 50\%$
- Size of urban centres:
  - Urban centre  $> 200000$  inh. and more than 25% of regions' population: rural region becomes intermediate
  - Urban centre  $> 500000$  inh. and more than 25% of regions' population: intermediate region becomes predominantly urban

## OECD urban rural typology applied to NUTS 3 regions

## OECD urban rural typology applied to NUTS 3 regions

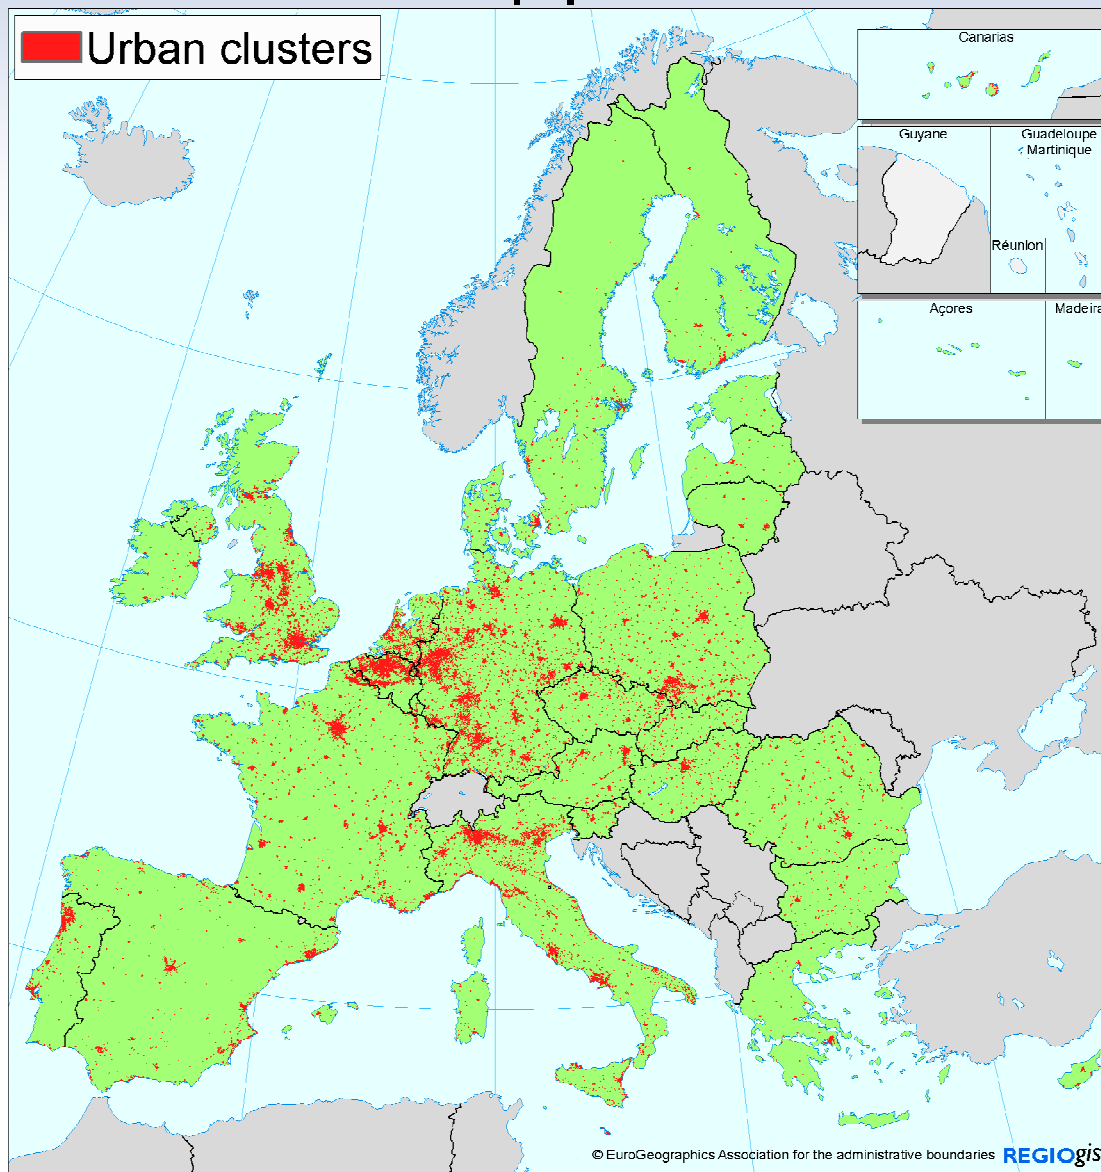

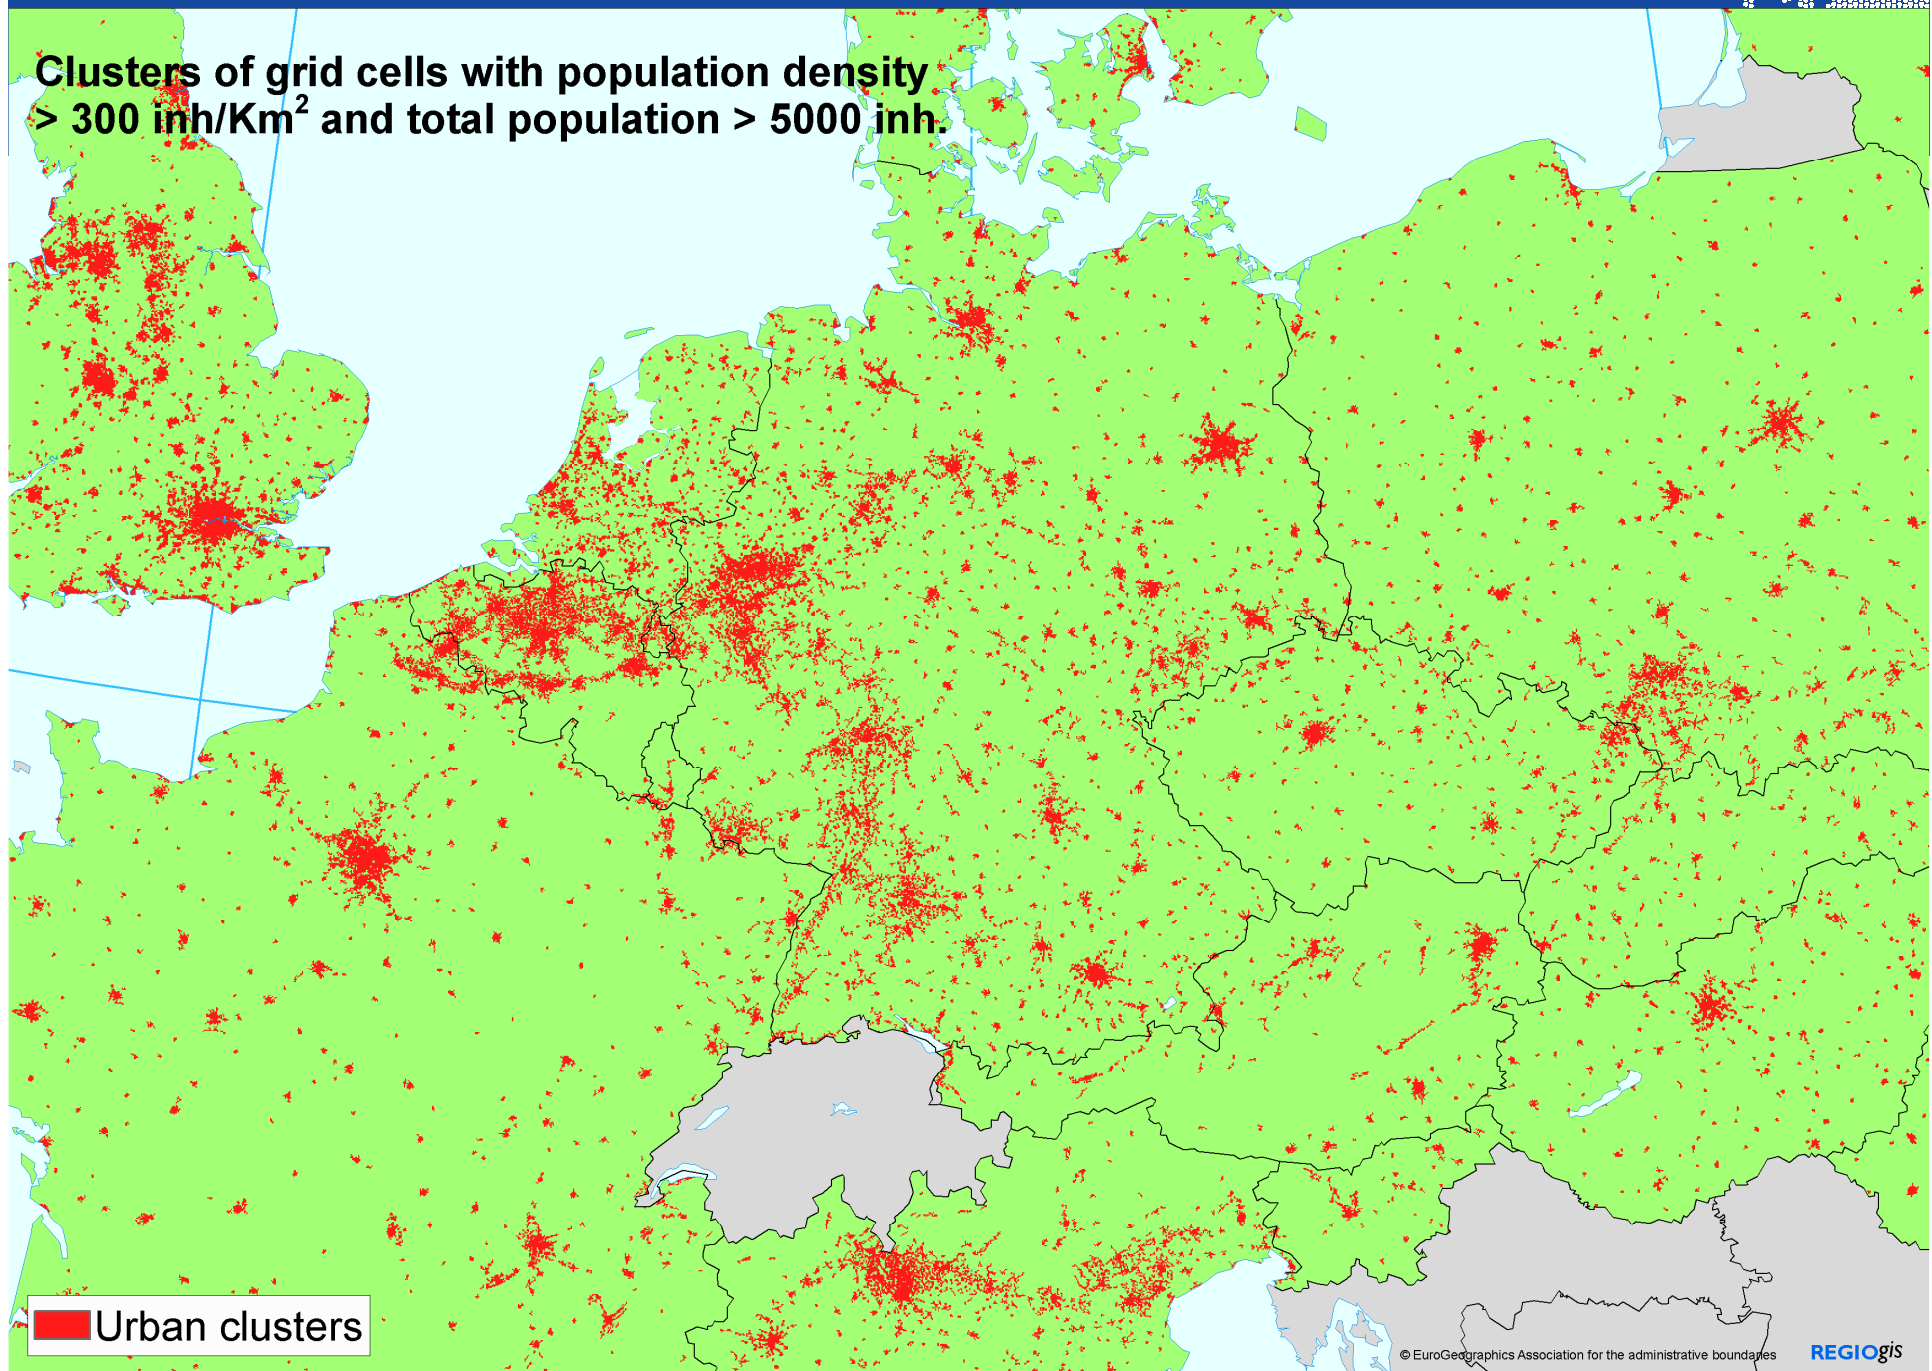

# The new typology: local level

- Units: 1 km<sup>2</sup> grid cells
- Population grid: registered population when available, otherwise disaggregation grid (JRC)
- Identify population living in urban areas:
  - Selection of grid cells with density > 300 inh./km<sup>2</sup>
  - Only groups of grid cells, representing a total population of > 5000 inhabitants
  - Contiguity is evaluated including diagonals

**Clusters of grid cells with population density  
> 300 inh./km<sup>2</sup> and total population > 5000 inh.**

Clusters of grid cells with population density  
> 300 inh/Km<sup>2</sup> and total population > 5000 inh.

## Results at local level

- 32% of EU population lives in “rural” raster cells
- More balanced distribution in comparison to OECD result:
  - Increase of rural population in densely populated countries
  - Decrease of rural population in sparsely populated countries with large local administrative units

# The new typology: regional level

- Principle: three categories of regions, based on the population share in rural raster cells
  - Predominantly urban: population share of rural raster cells  $< 20\%$
  - Intermediate: population share of rural raster cells between 20% and 50%
  - Predominantly rural: population share of rural raster cells  $> 50\%$

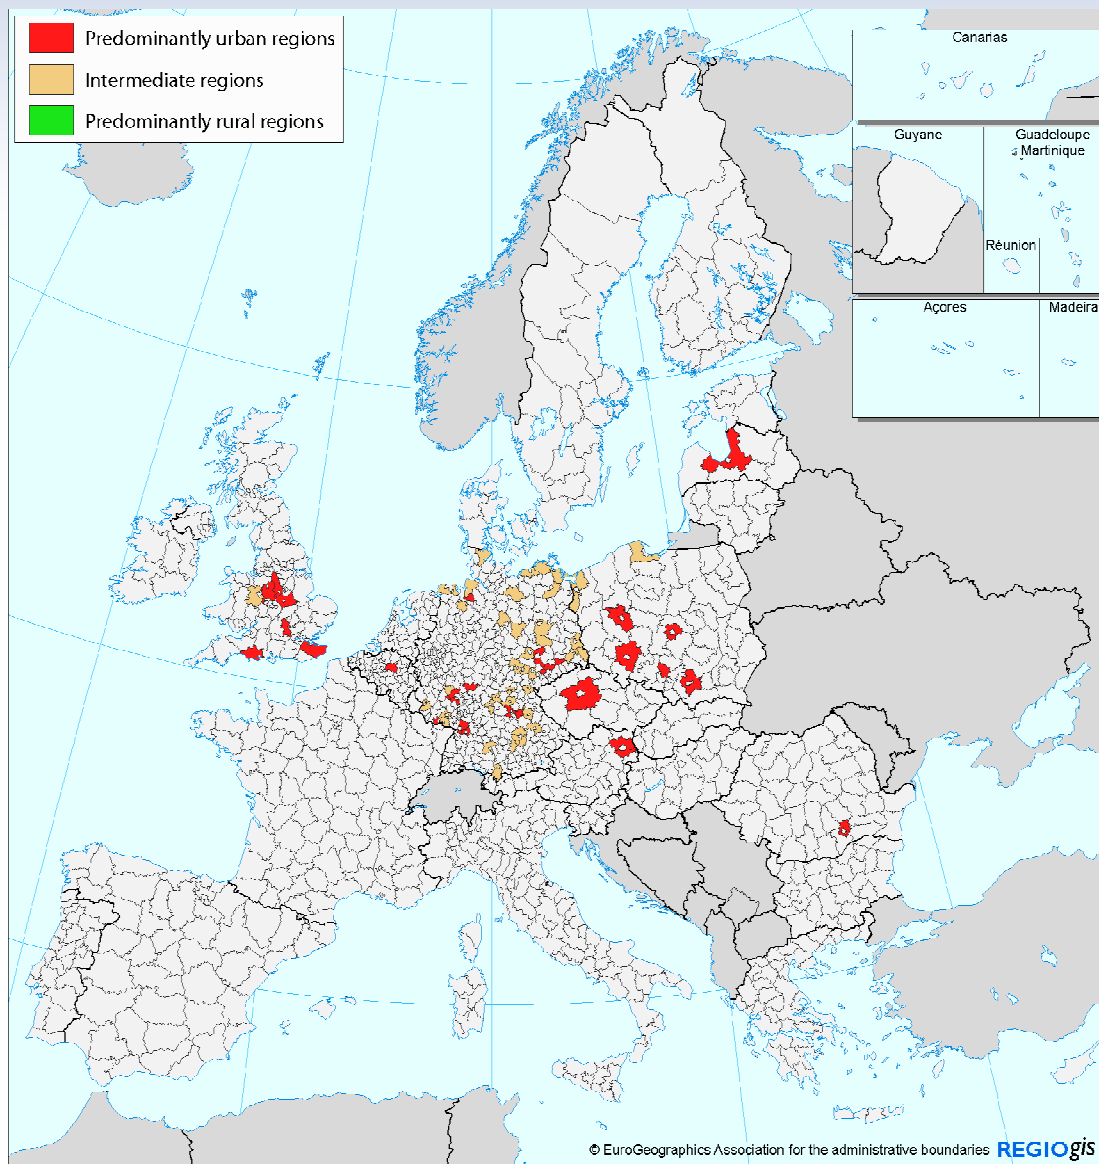

# Classifying small NUTS3 regions

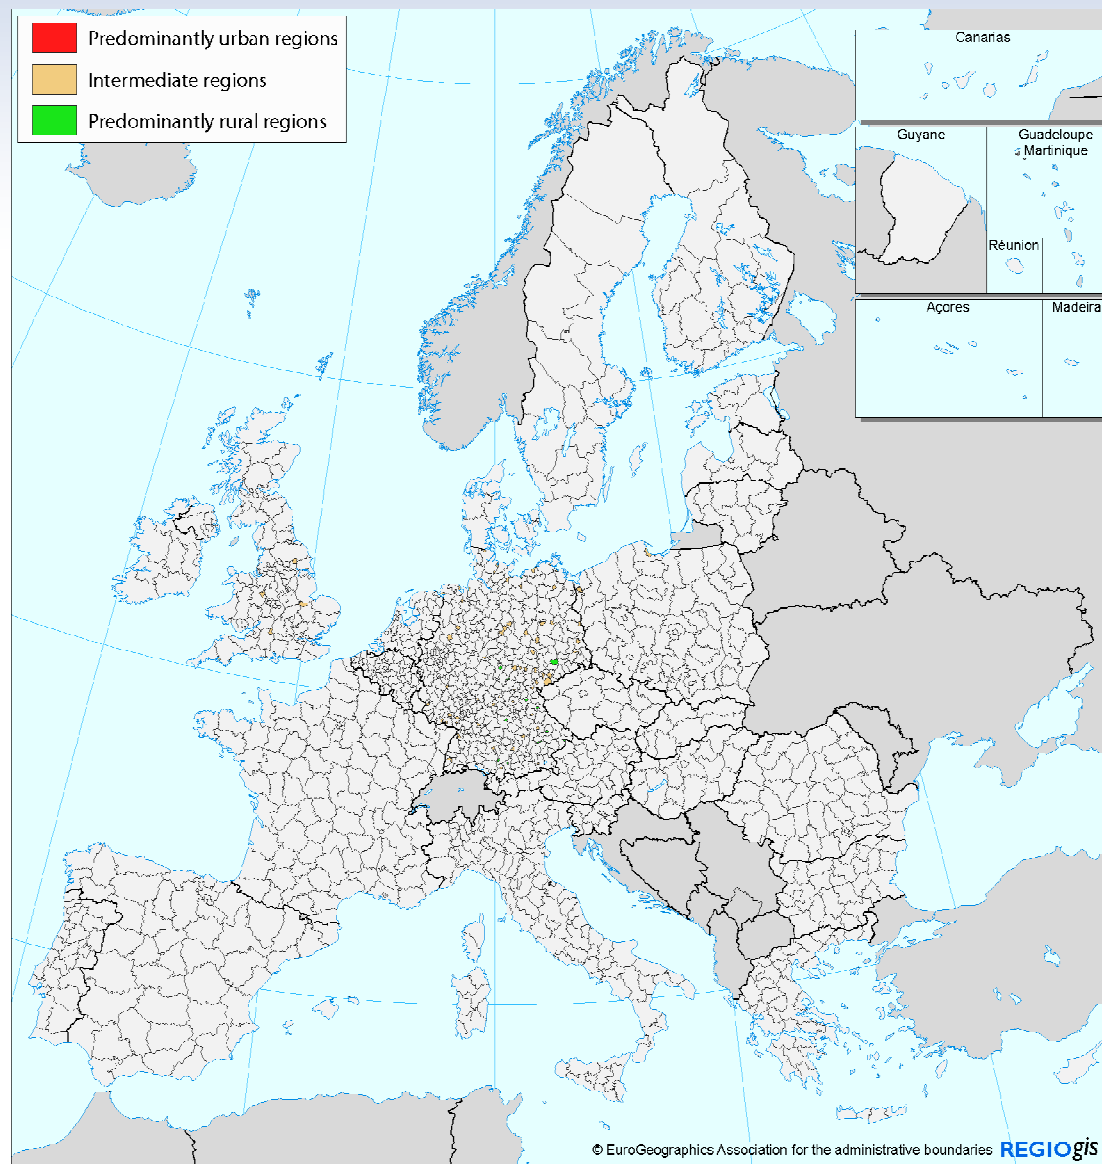

- 247 NUTS3 regions are smaller than 500 km<sup>2</sup>
- Enhance the comparability of the classification by combining small NUTS3s with their neighbour(s)
  - Only for the sake of determining the type of NUTS3 region
  - Only when the combination of regions makes a difference in the resulting typology
  - 142 NUTS3 regions have been grouped into 114 groupings

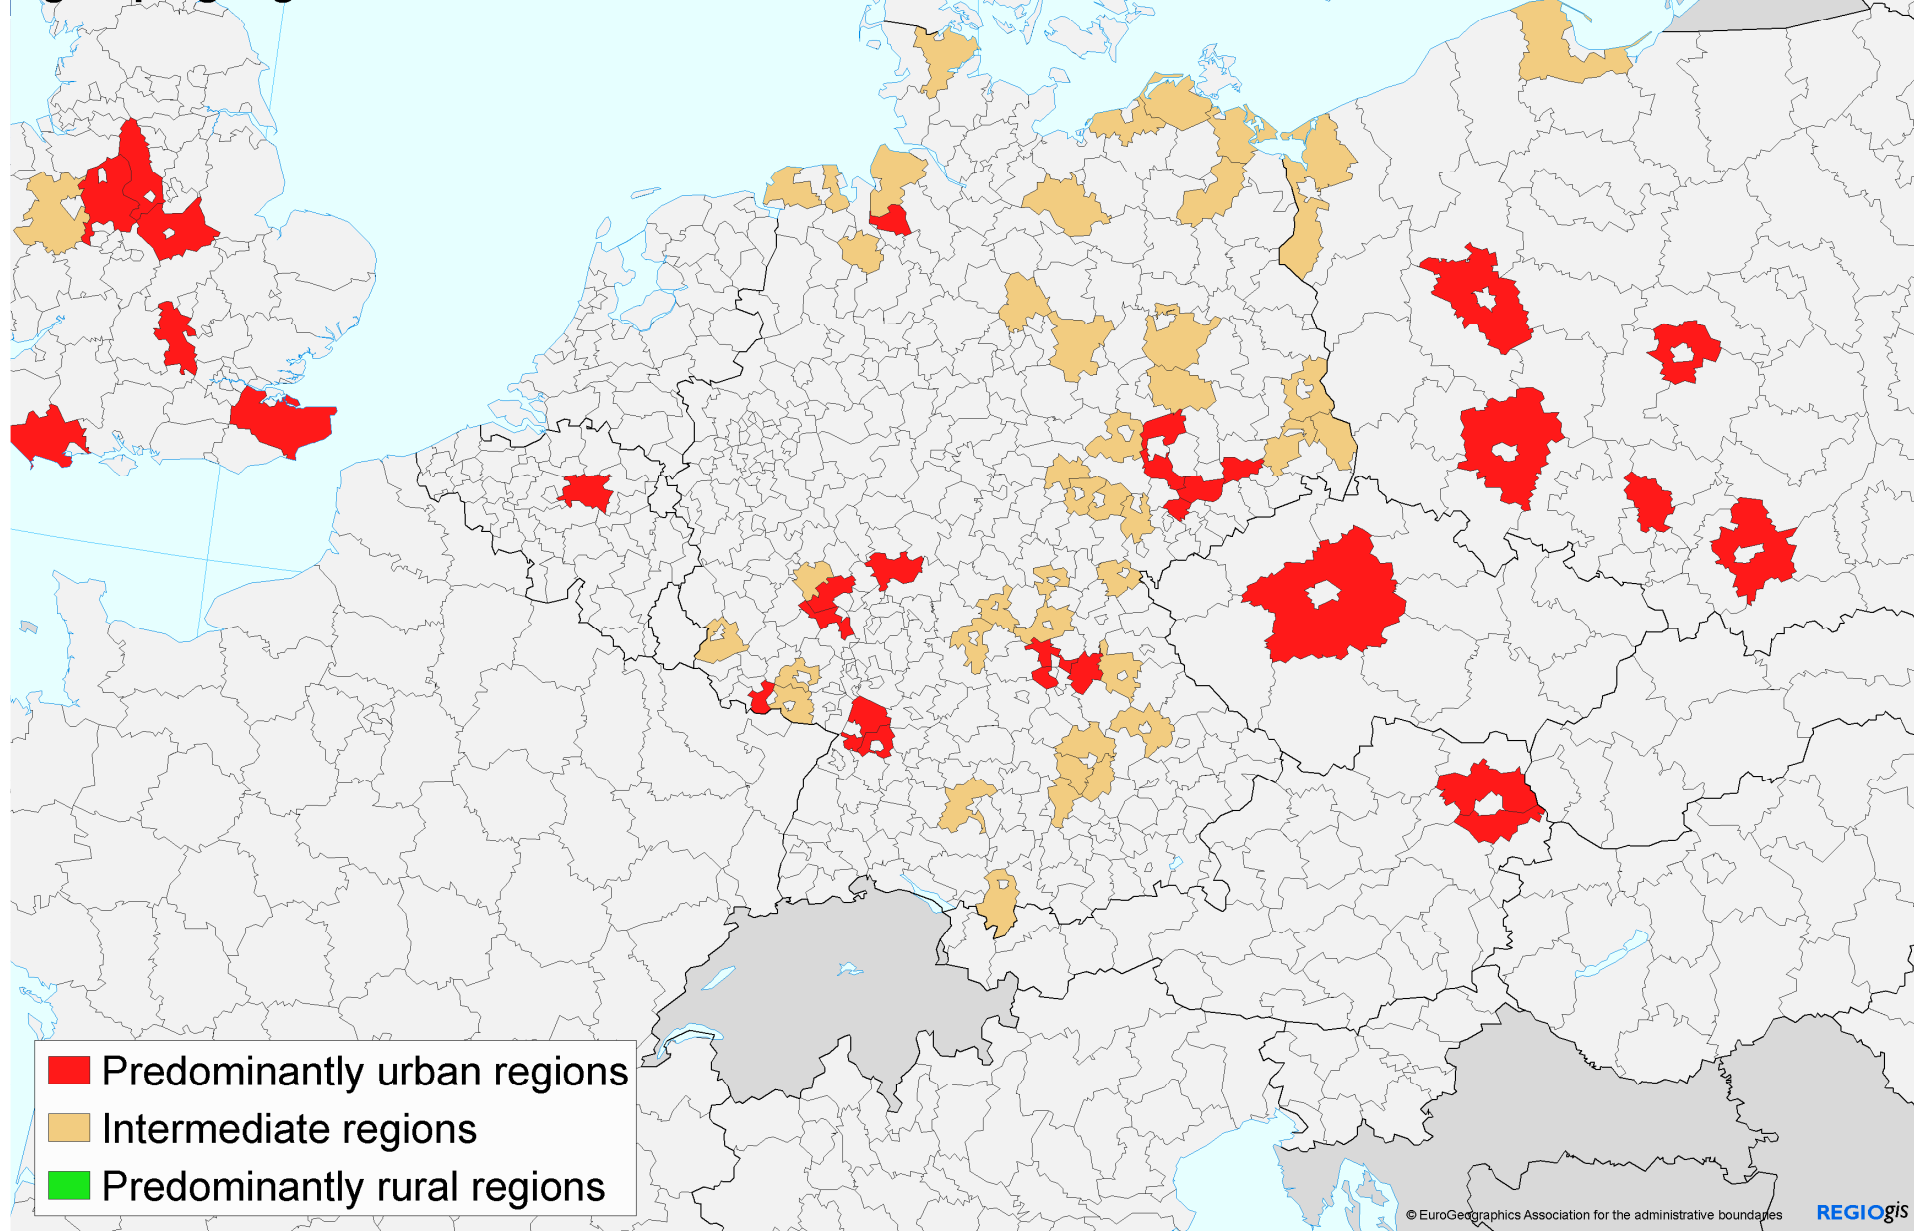

## NUTS 3 regions classified as more urban when grouping regions of less than 500 km<sup>2</sup>

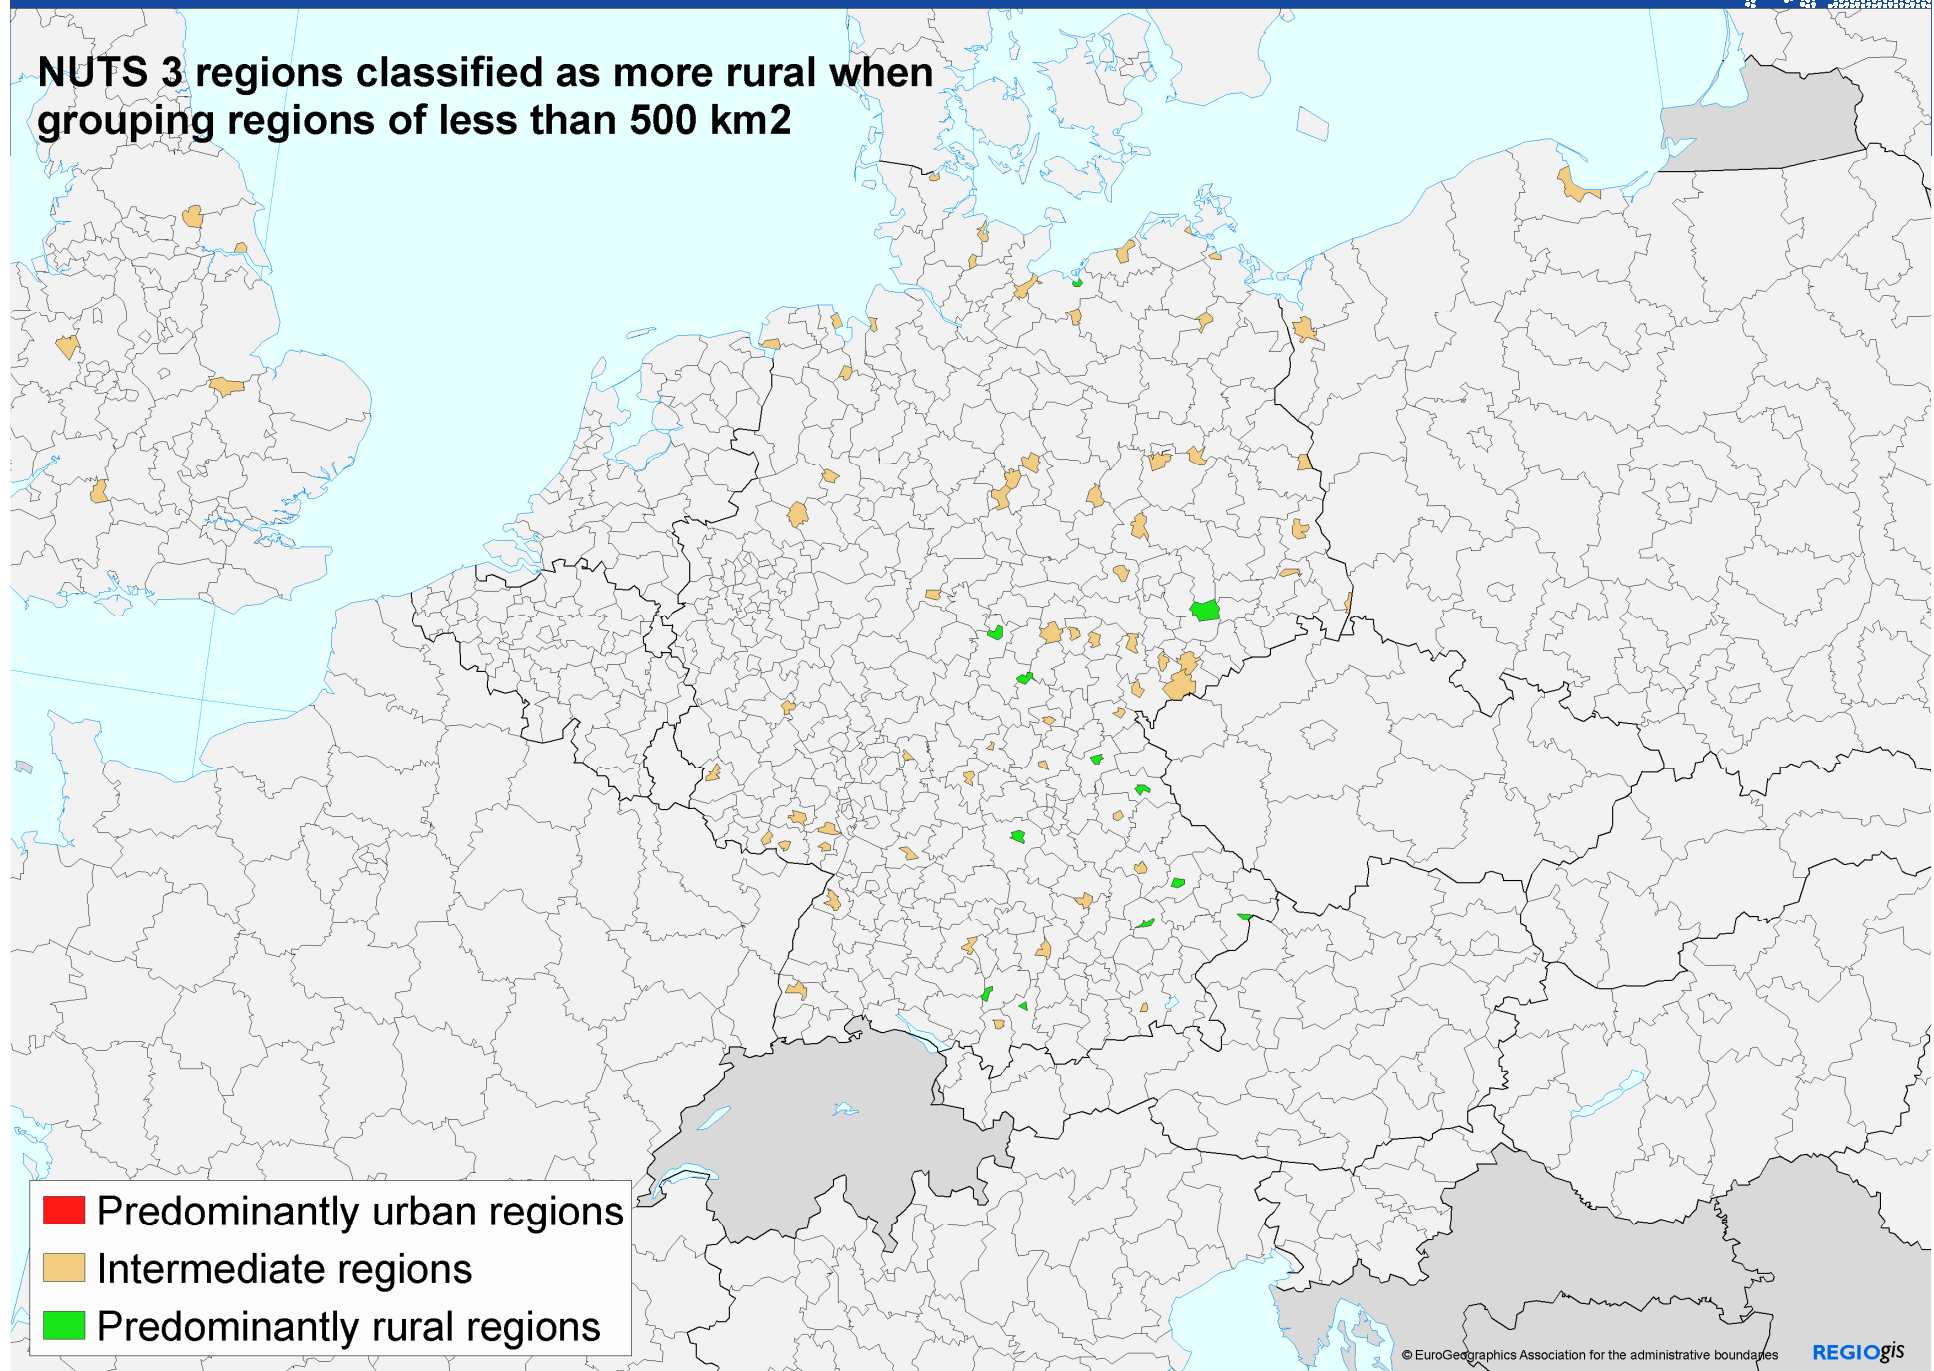

## NUTS 3 regions classified as more rural when grouping regions of less than 500 km<sup>2</sup>

# NUTS 3 regions classified as more urban when grouping regions of less than 500 km2

## NUTS 3 regions classified as more rural when grouping regions of less than 500 km<sup>2</sup>

# The influence of major cities

- The presence of cities is taken into account in the same way as in the OECD typology
  - 7 regions move from predominantly rural to intermediate (with cities > 200,000 inh.)
  - 16 regions move from intermediate to predominantly urban (with cities > 500,000 inhabitants)

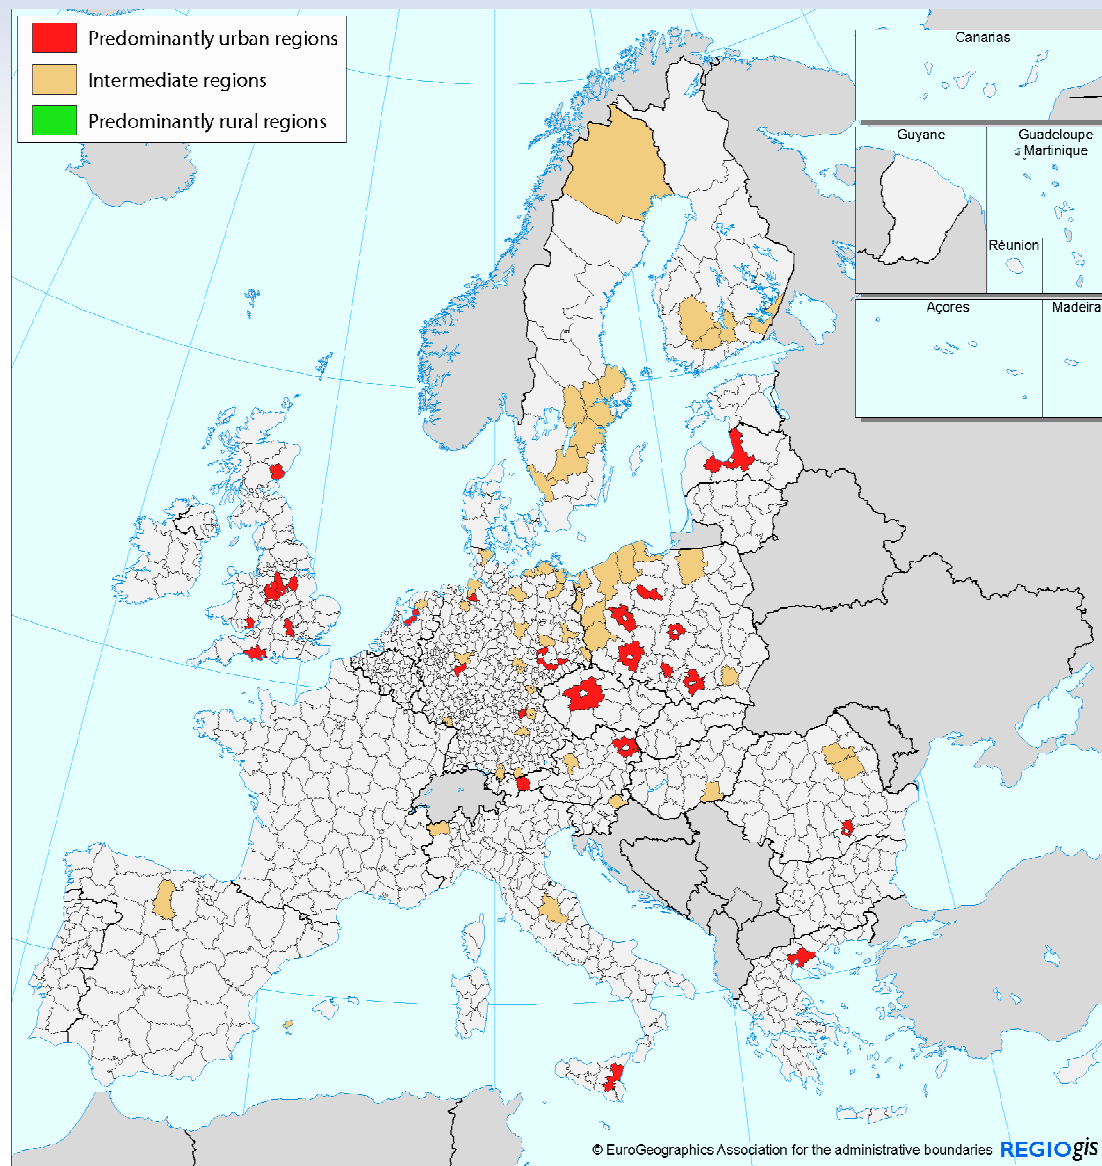

# Results, compared to the OECD typology

- Increase of EU population share in predominantly rural regions
- Intermediate regions' population share is stable
- Decrease of population share in predominantly urban regions
- Less urban: BE, NL
- Less rural: FI, SE

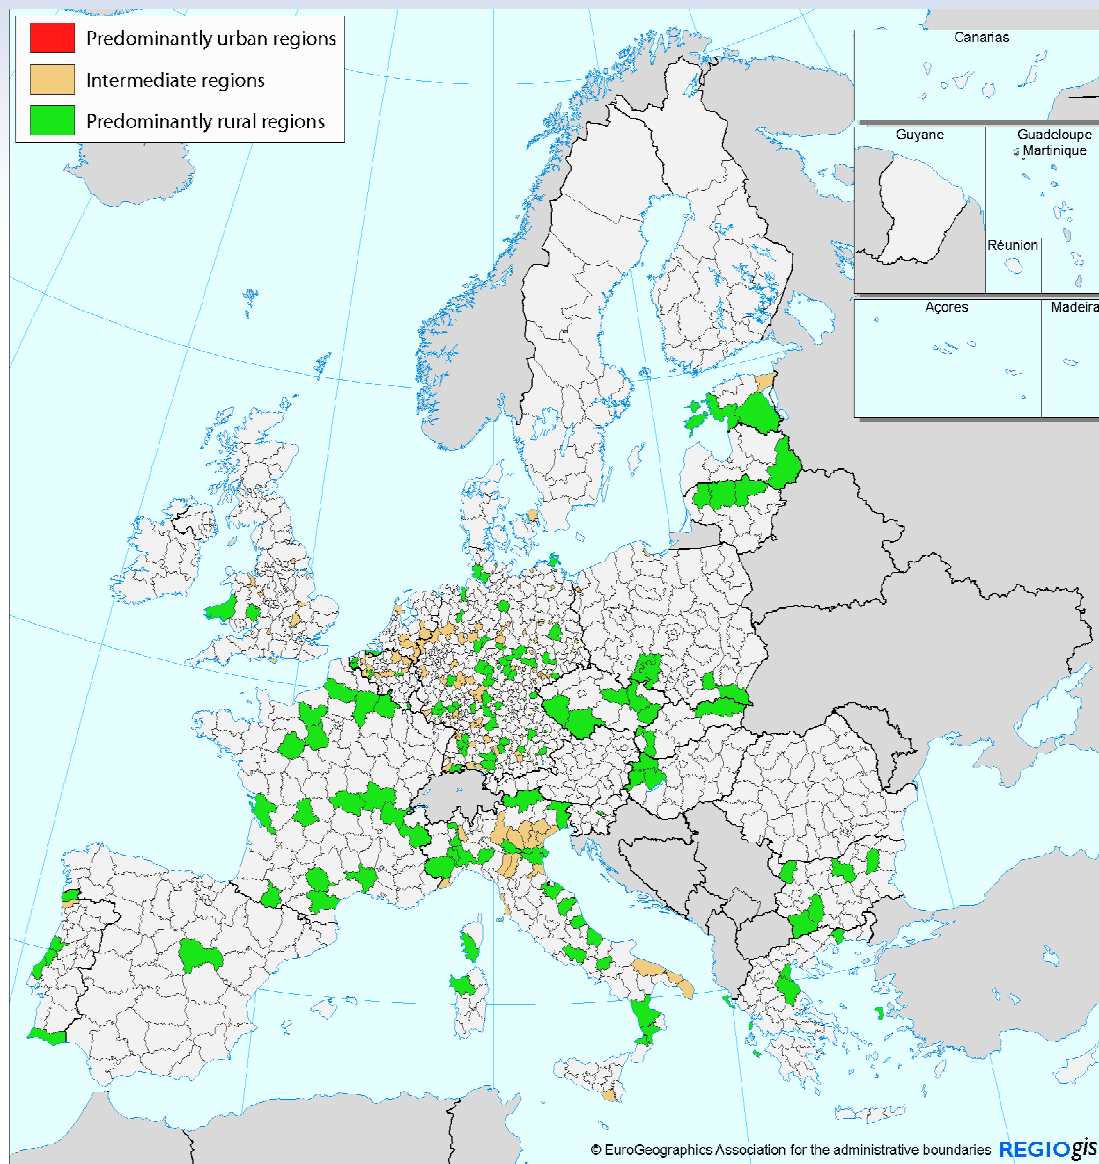

## NUTS 3 regions classified as more urban in comparison to the OECD typology

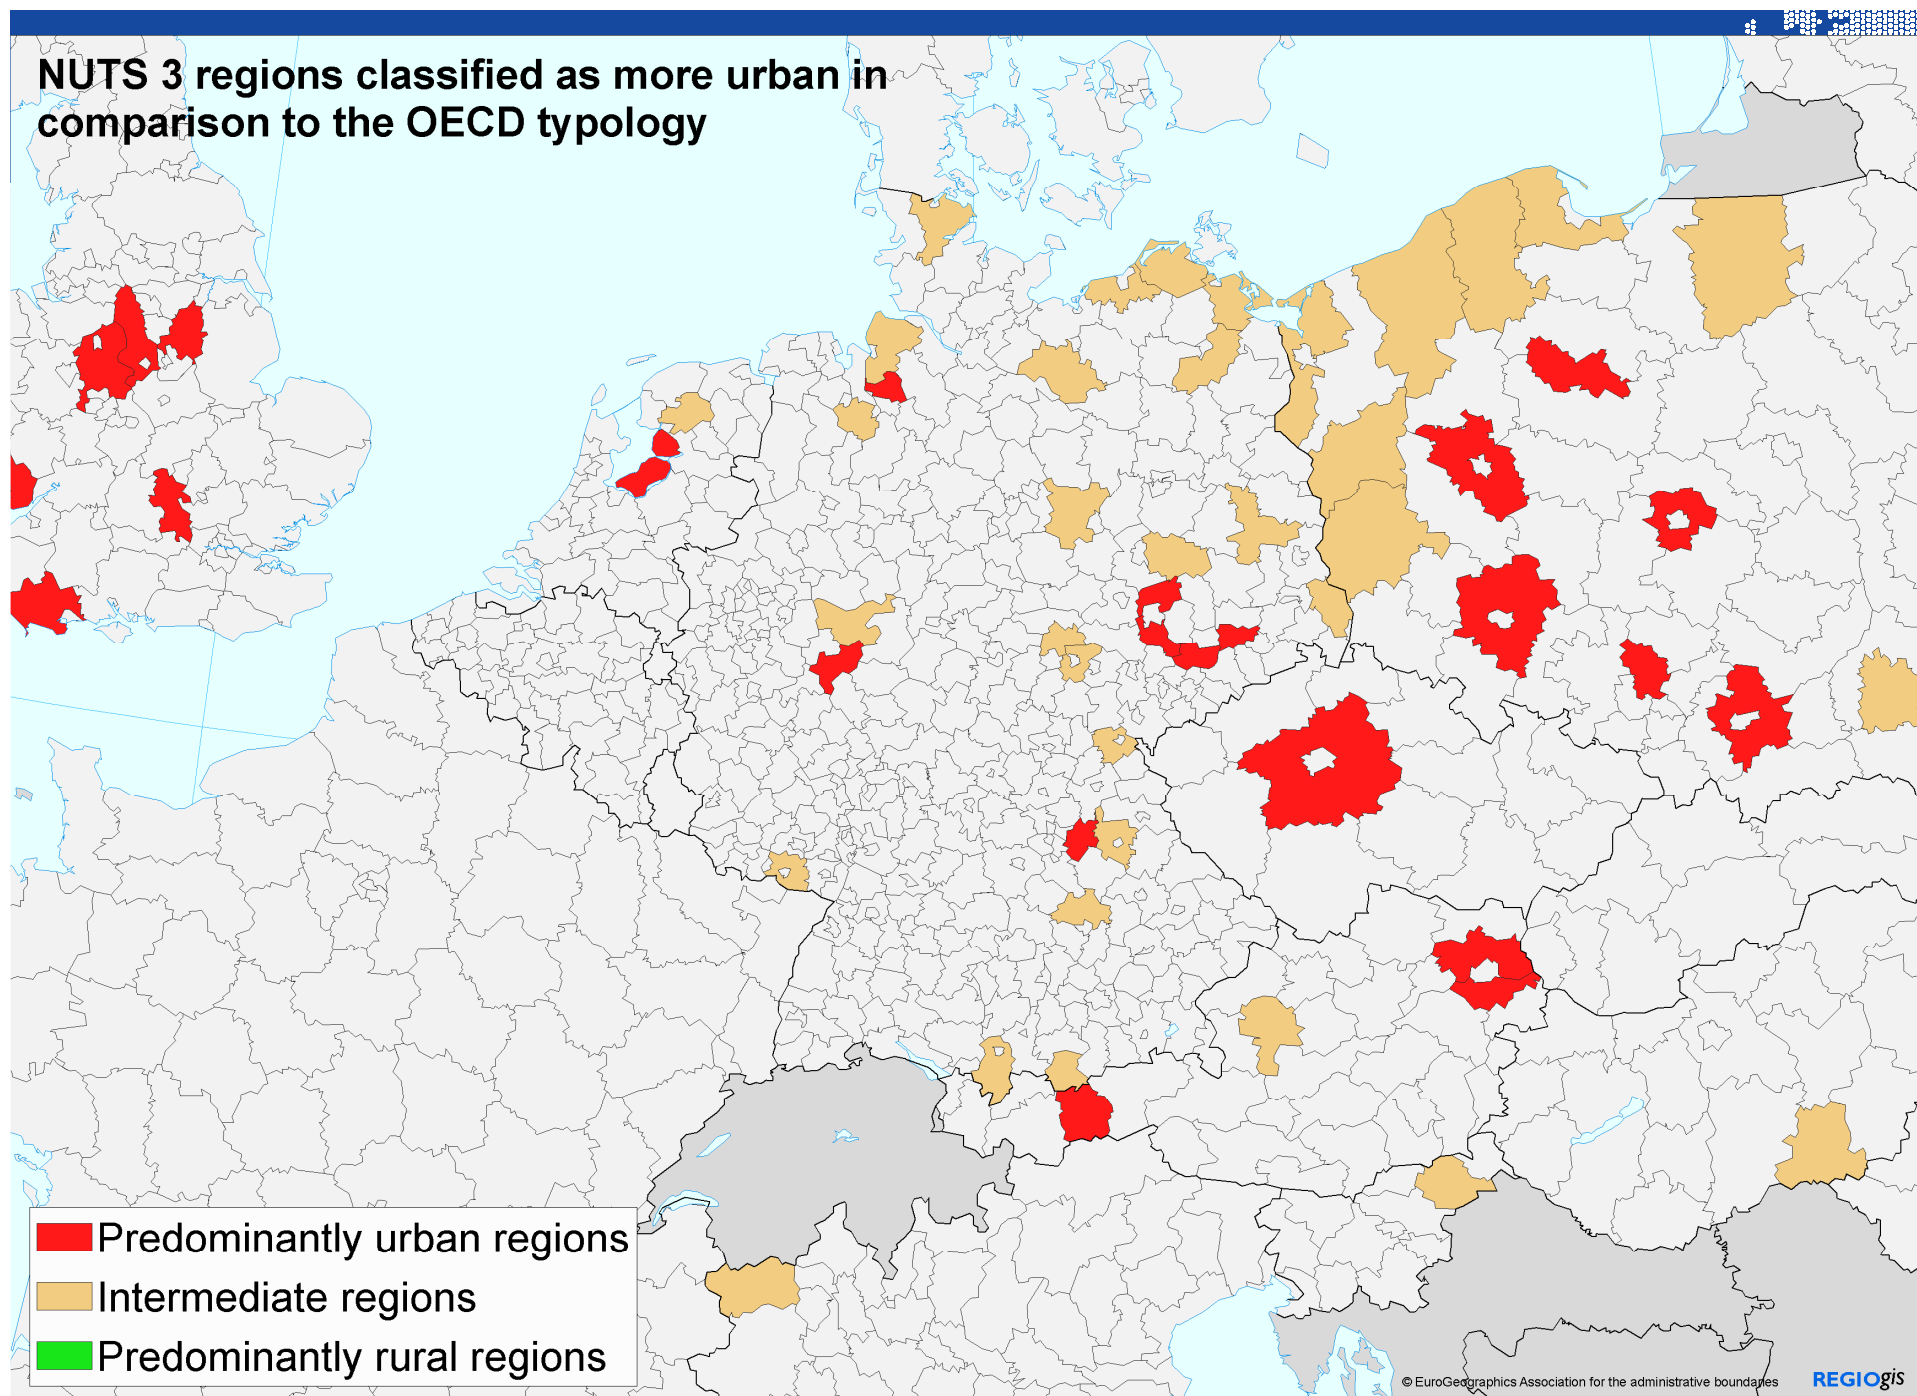

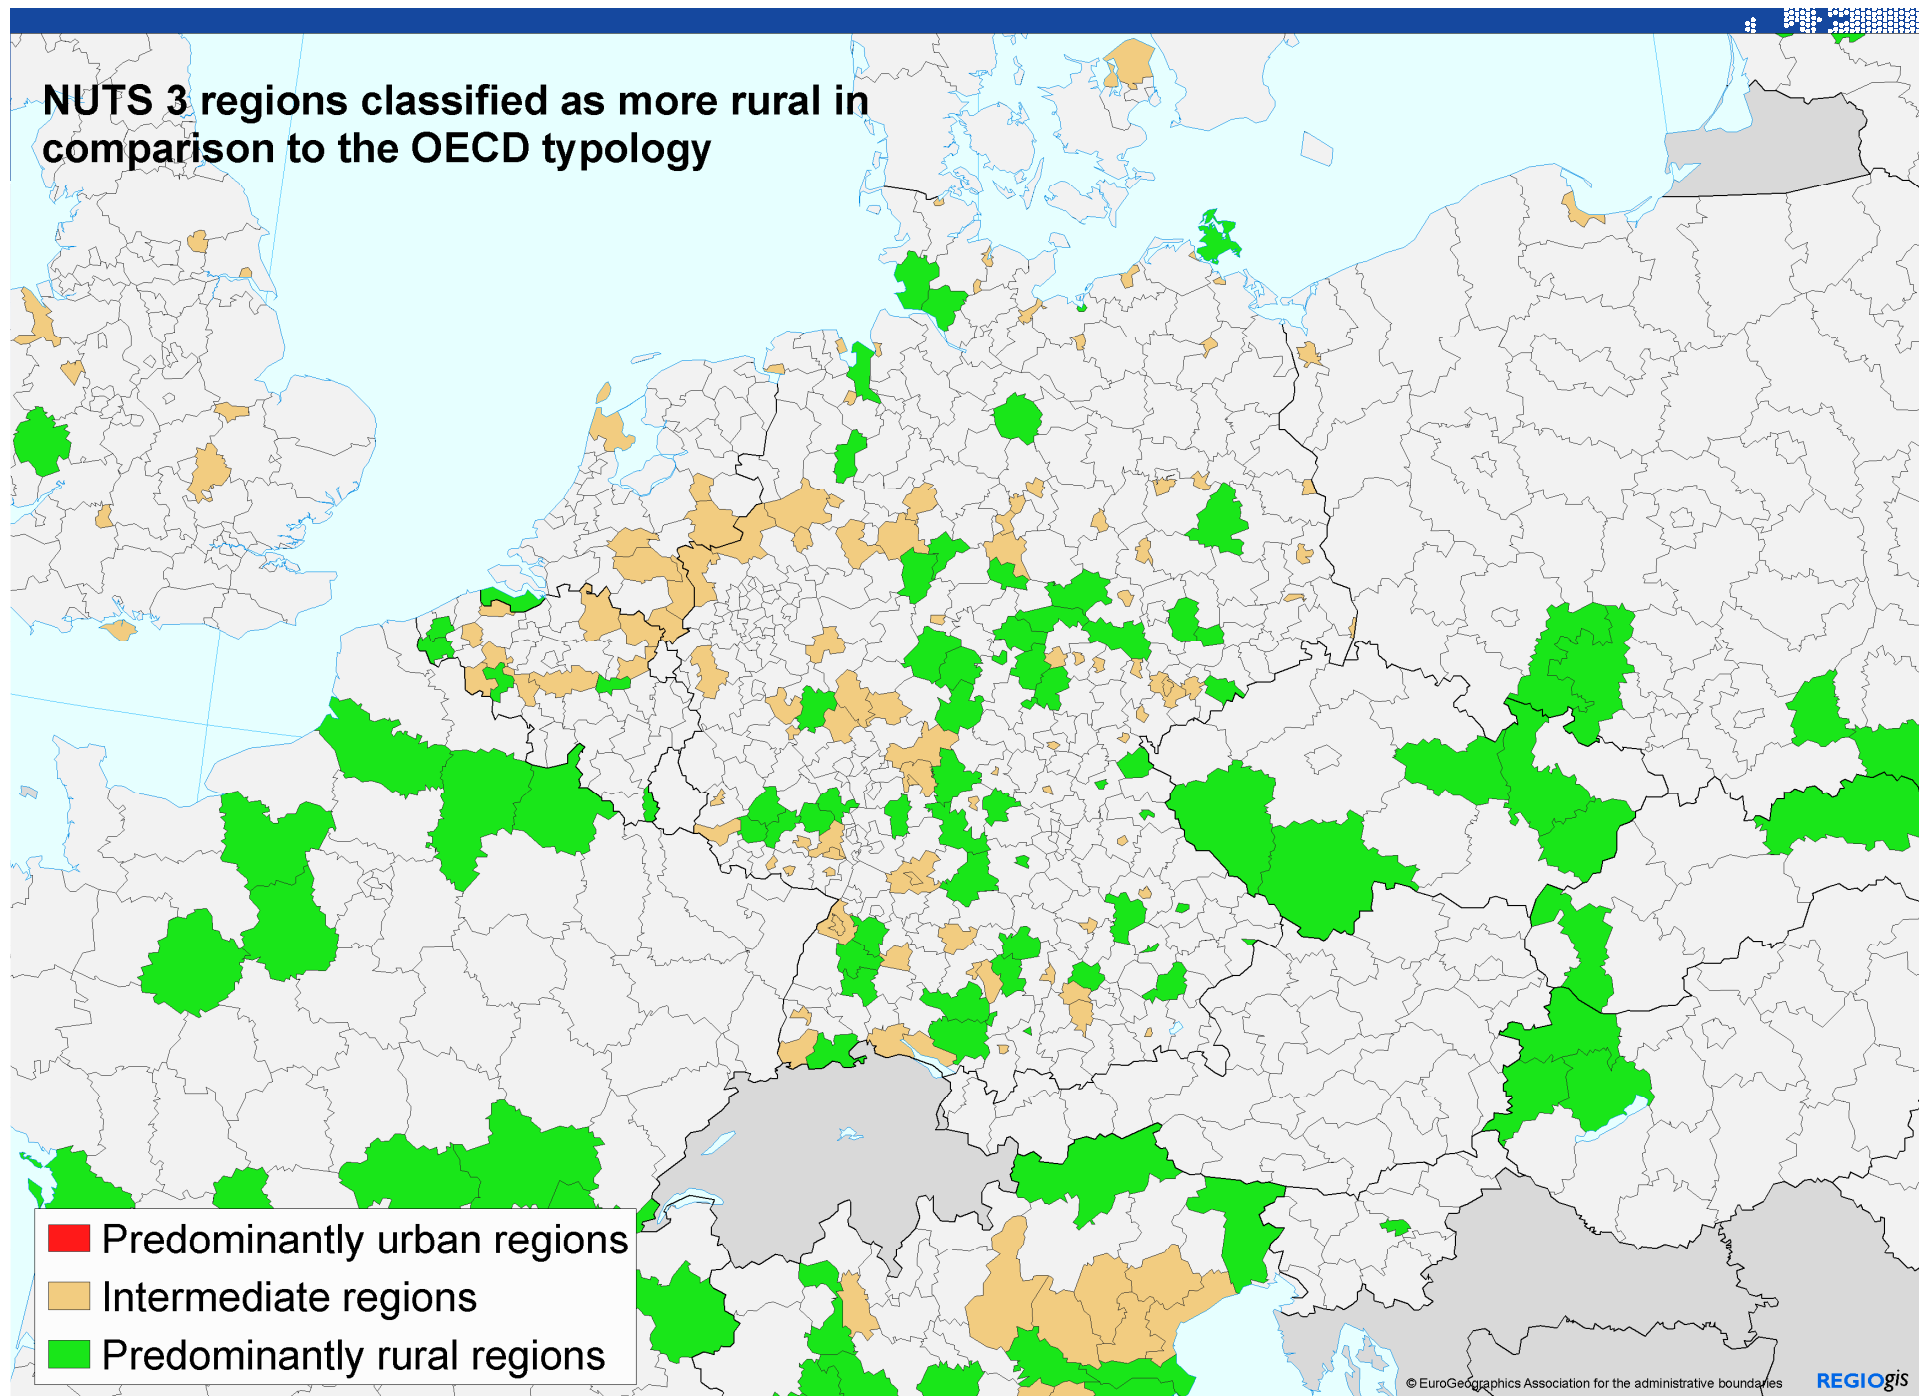

## NUTS 3 regions classified as more rural in comparison to the OECD typology

## NUTS 3 regions classified as more urban in comparison to the OECD typology

## NUTS 3 regions classified as more rural in comparison to the OECD typology

# Future developments

- Typology to be updated after NUTS modification
- Update foreseen based on new population grid (e.g. including new census data and/or new land cover data)
- Urban/rural classification of LAU2 units, based on grid data
