

A proposal for Brazilian 2010 Census dissemination

Ms Maria do Carmo Dias Bueno, IBGE/CDDI/COPES, Brazil

Abstract

This paper shows the evolution of census mapping and address list in the Brazilian Institute of Geography and Statistics - IBGE since 2000. It demonstrates how the incorporation of geotechnologies into the processes of data collection for household surveys allows new forms of dissemination. The proposal for the dissemination of 2010 Population Census provides a micro database query over the internet, permitting data recovery with a small level of aggregation for the areas established by users. Finally, a reflection is offered upon the possible creation of specifically delimited output areas, mainly aiming the needs of spatial and temporal comparison.
