Statistics Bulgaria

Abstract:

Keywords: Statistical production chain, spatial dimension

The statistical offices of Bulgaria and Norway take part in the GEOSTAT project and are working with integrating grid statistics as a part of the production chain. The two offices have different traditions for using GIS as part of their work. Based on the experiences from the statistical offices of Bulgaria, Norway and other countries the presentation will try to answer the question: Is there an ideal way to integrate the spatial dimension into the statistical production chain of a statistical office.
