

Geostat 2: Some experiences and conclusions – applying the GSBPM to geospatial statistical data production

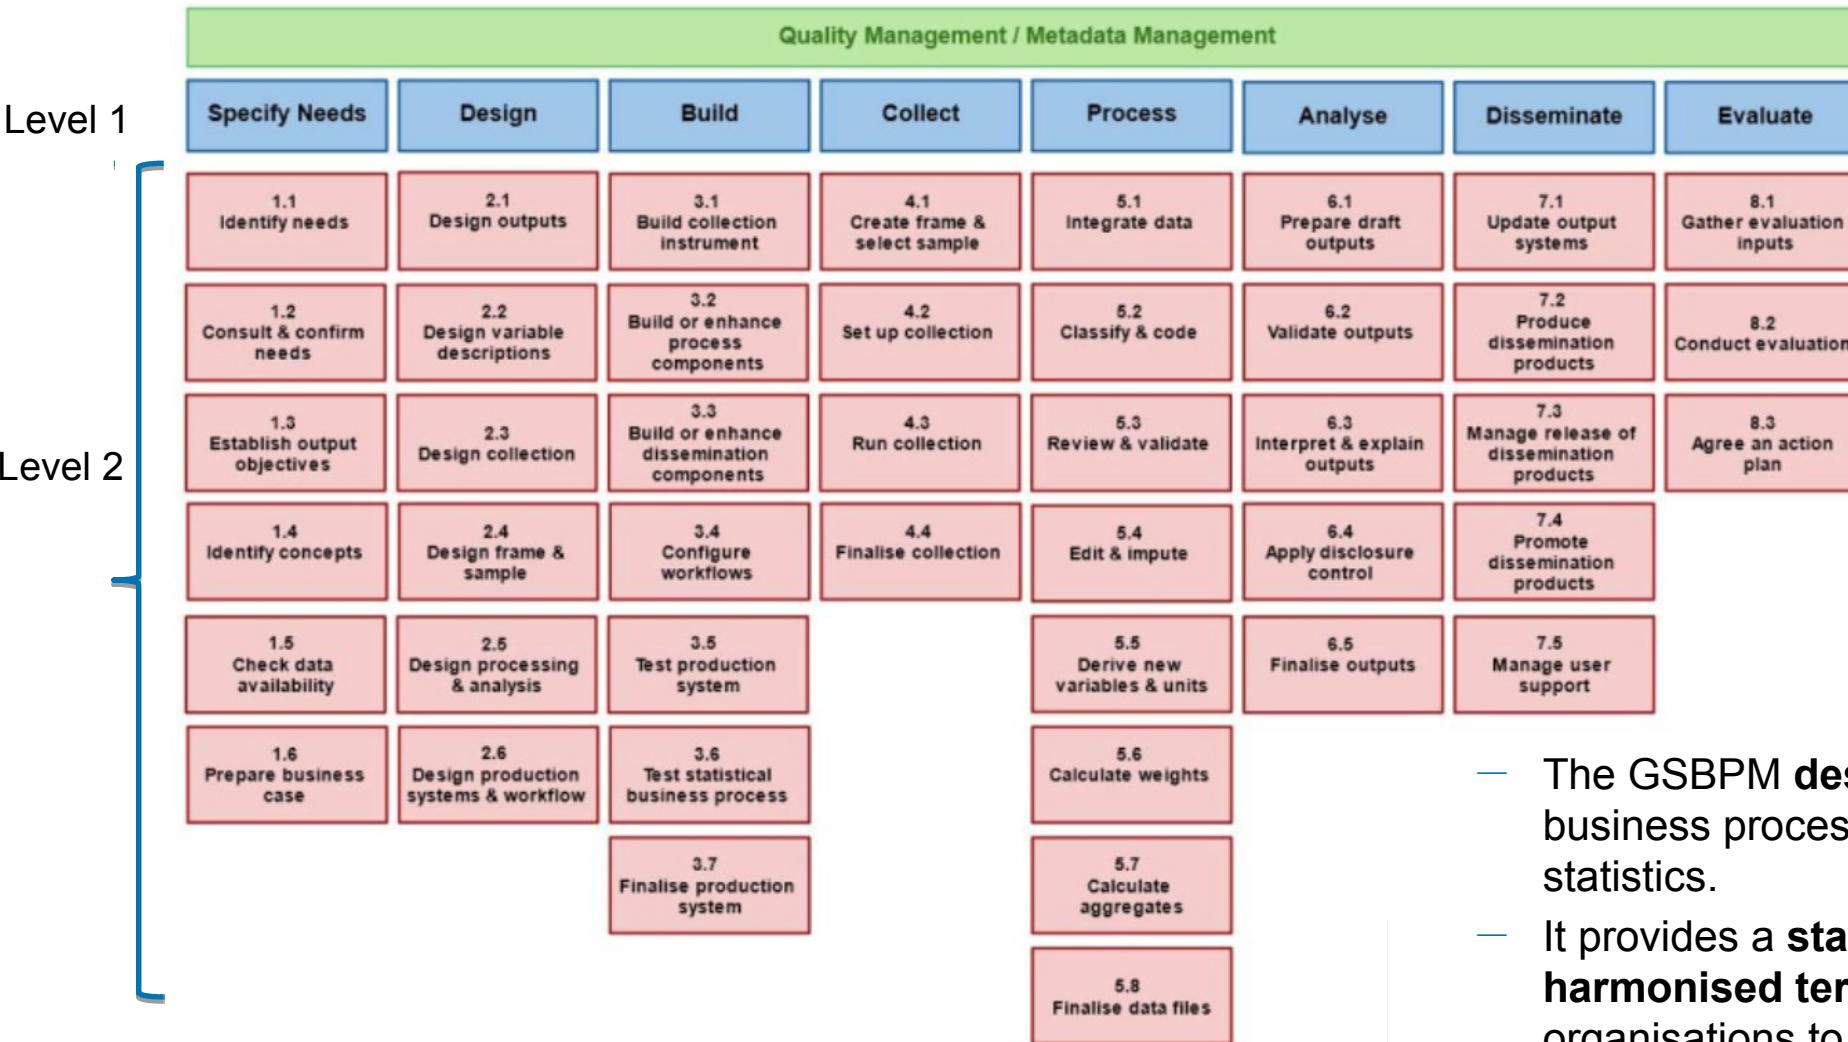

Rina Tammisto, Marja Tammilehto-Luode, Tuuli Pihlajamaa
European Forum for Geography and Statistics Conference 2016, Paris
15 November 2016

Geostat 2, Work Package 1:

Geospatial data and the GSBPM

- Evaluate *The Generic Statistical Business Process Model (GSBPM)* from the point of view of *geospatial data* is involved in the statistical production process
 - Is the GSBPM usable?
 - What using requires?
 - Common view of the issues that should be developed
 - In the GSBPM model itself or
 - In its documentation (concrete suggestions if possible)
- In parallel with the project the *Global Statistical Geospatial Framework (GSGF)* was prepared – a wider perspective where to locate our work

GSBPM, The Generic Statistical Business Process Model

- The GSBPM **describes and defines** the set of business processes needed to produce official statistics.
- It provides a **standard framework** and **harmonised terminology** to help statistical organisations to modernise their statistical production processes, as well as to **share** methods and components.

The GSBPM documentation

<http://www1.unece.org/stat/platform/display/metis/The+Generic+Statistical+Business+Process+Model>

5.1. Integrating data

75. This sub-process integrates data from one or more sources. It is where the results of sub-processes in the "Collect" phase are combined. The input data can be from a mixture of external or internal data sources, and a variety of collection modes, including extracts of administrative data. The result is a set of linked data. Data integration can include:

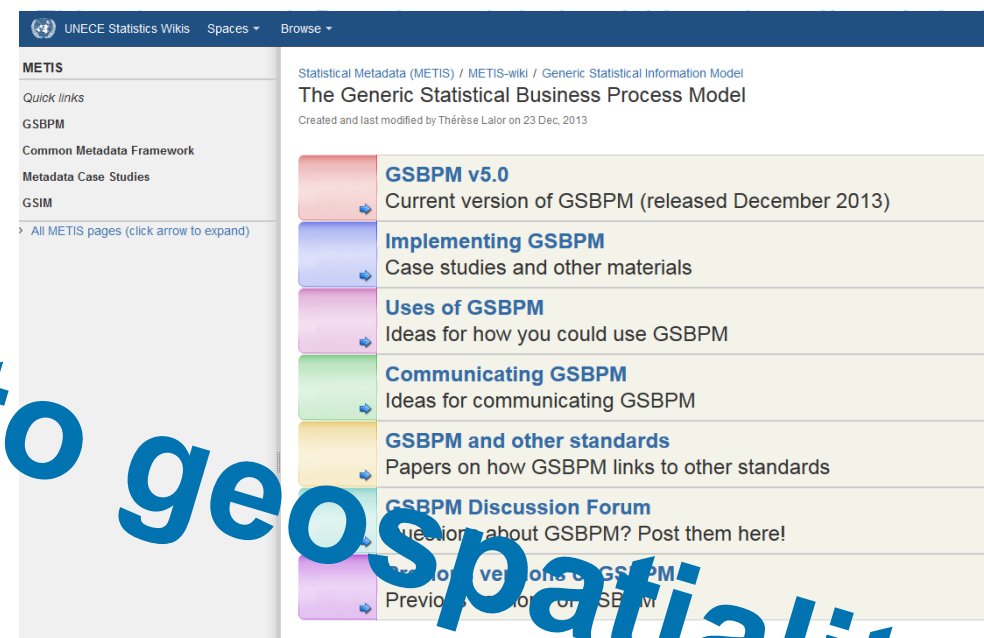

- combining data from multiple sources, as part of the creation of integrated statistics such as national accounts
- matching / record linkage routines, with the aim of linking micro or macro data from different sources
- prioritising, when two or more sources contain data for the same variable, with potentially different values

76. Data integration may take place at any point in this phase, before or after any of the other sub-processes. There may also be several instances of data integration in any statistical business

2.1. Design outputs

49. This sub-process contains the detailed design of the statistical outputs, products to be produced, including the related development work and preparation of the systems used in the "Disseminate" phase. Disclosure control methods, as well as processes for dealing with any confidential outputs are also designed here. Outputs should be designed to conform with standards wherever possible, so inputs to this process may include metadata from national collections, international standards, and information about practices in other statistical systems from sub-process 1.1 (Identify needs).

2.2. Design variable descriptions

Integration of Geospatial data and Statistics

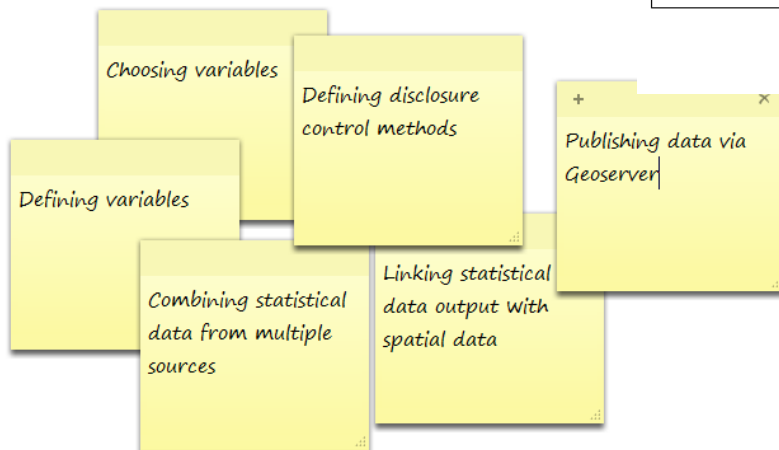

Modelling of processes

Story Mapping method:

<http://www.slideshare.net/SteveRogalsky/user-story-mapping-in-practice>

1. Writing down free cognitive associations (tasks) of the process
2. Classification of notes and identification of phases + completion by phases still missing
3. Identification of GSBPM phases + completion by phases still missing
4. Creation of the model + recognising actors

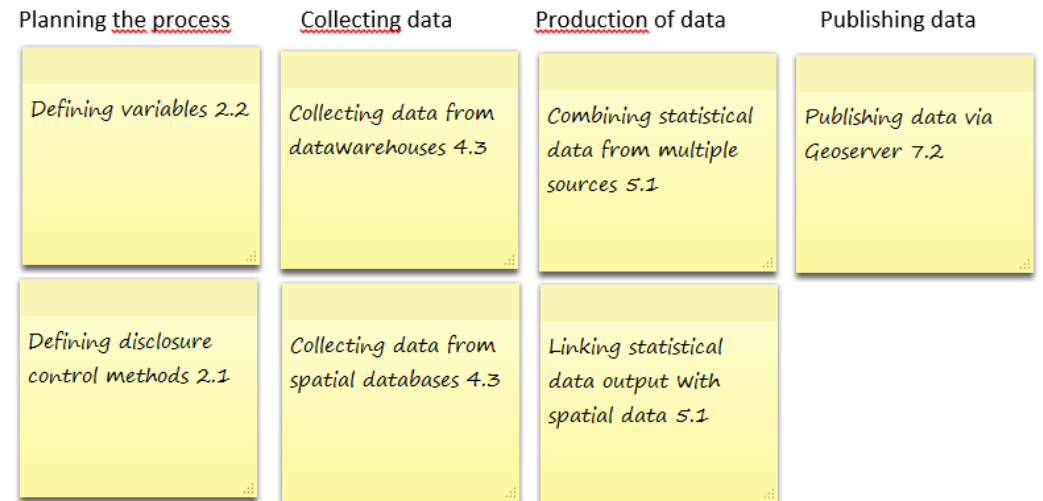

TASKS: CLASSIFICATION

IDENTIFICATION OF PHASES

IDENTIFICATION OF TASKS IN GSBPM

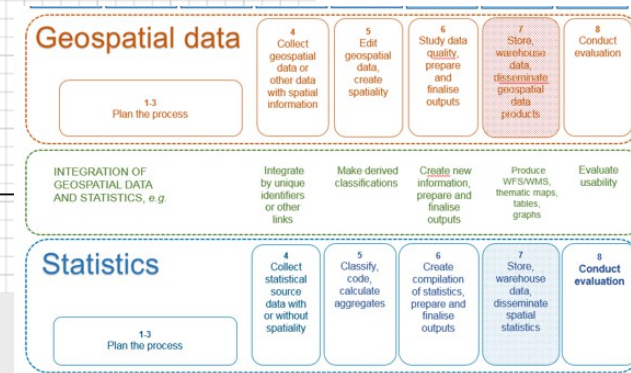

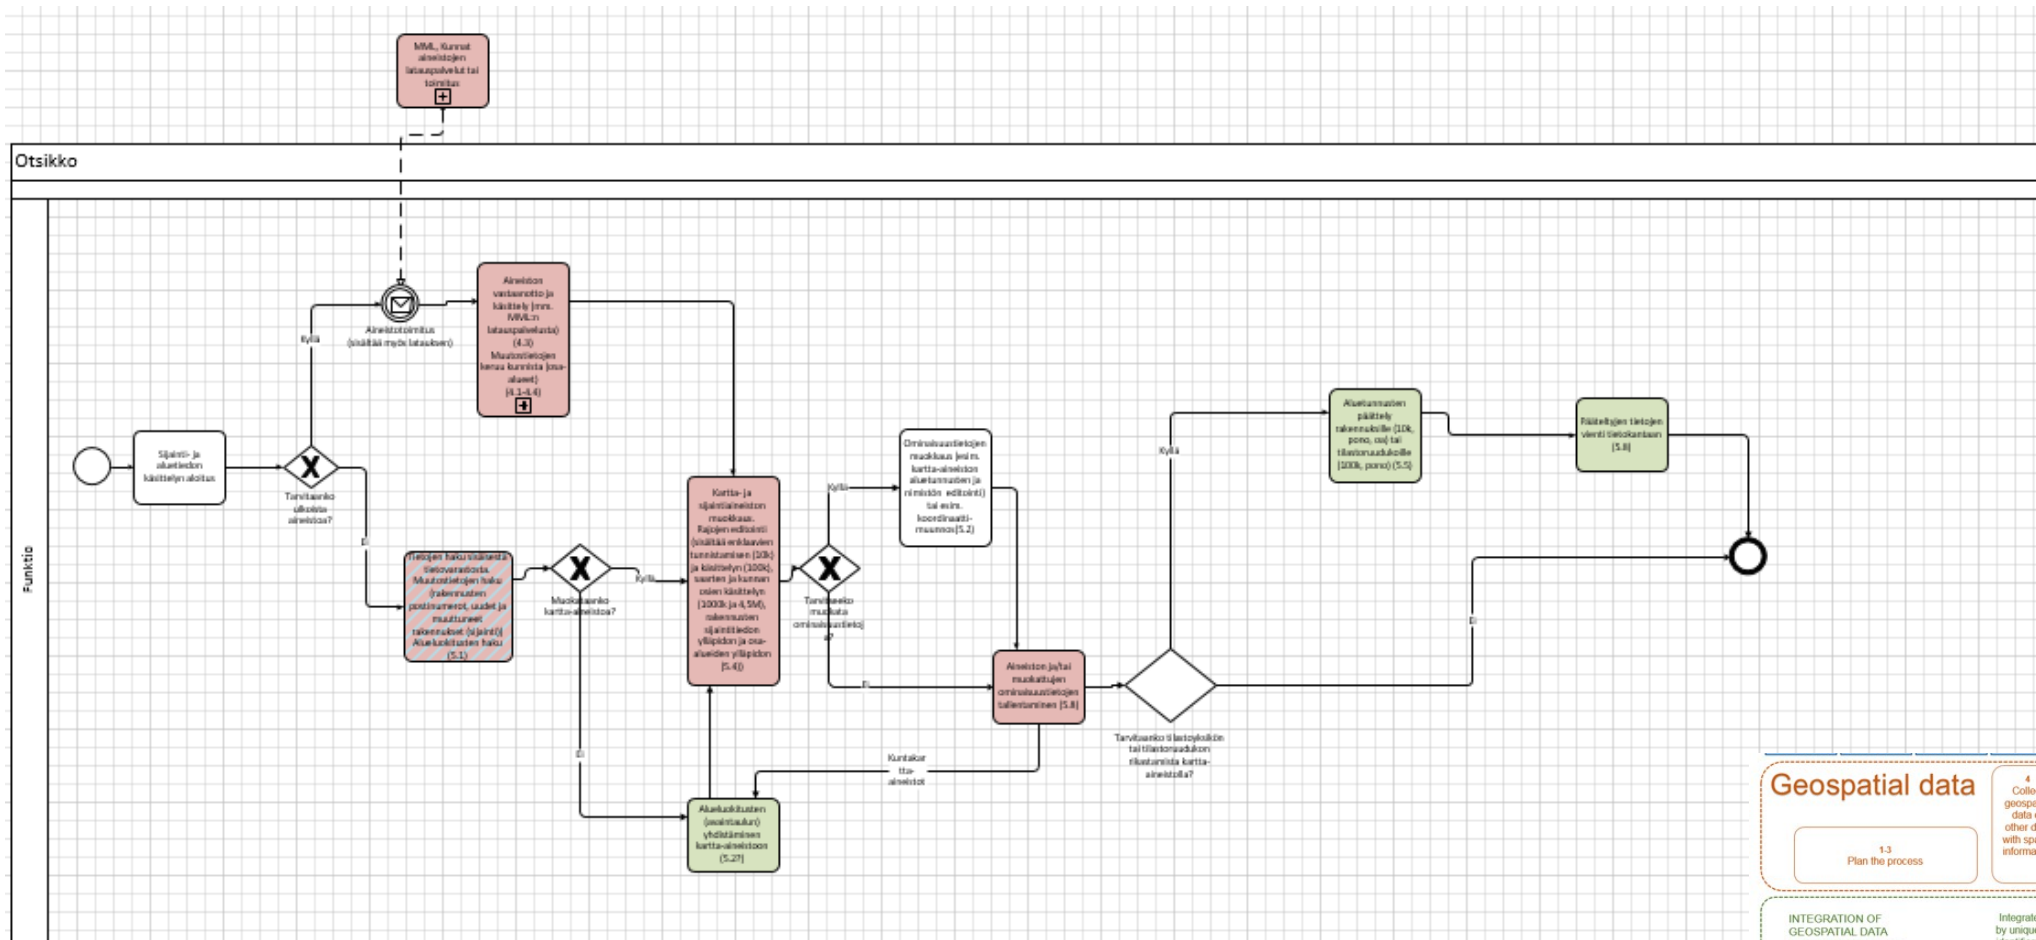

Main statistical geospatial related production process

Main production process of geospatial statistics with dimensions

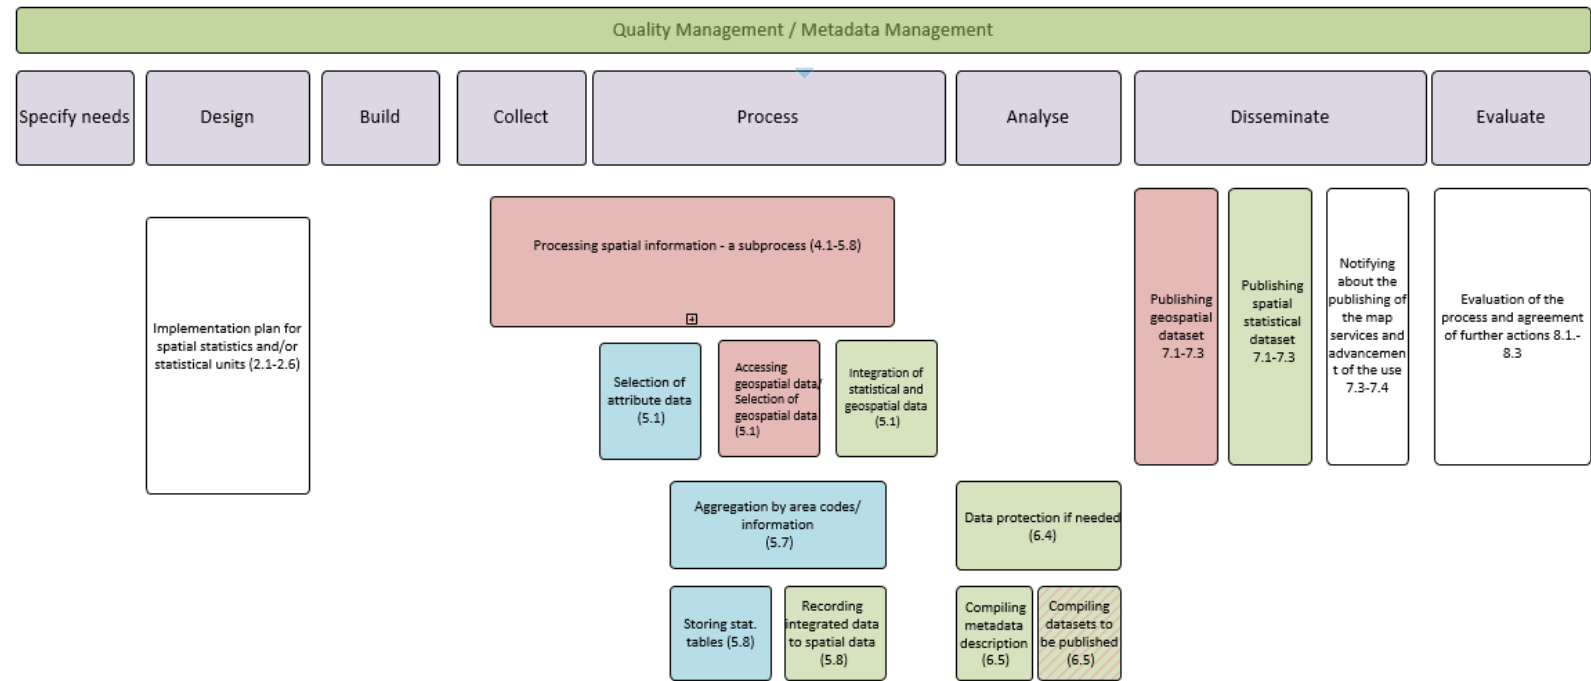

Sub-processes to maintain points and polygons (related to the main process) with dimensions

		GSBPM	INPUT	TASKS	OUTPUT
	Implementation plan for spatial statistics and/or statistical units		(2.1-2.6)		
X	Is processing of spatial information needed	<h1>A list of sub-processes and decision points</h1>			<div><div>Geospatial data</div><div><div>1-3 Plan the process</div><div>4 Collect geospatial data or other data with spatial information</div><div>5 Edit geospatial data, create spatiality</div><div>6 Study data quality, prepare and finalise outputs</div><div>7 Store warehouse data, disseminate geospatial data products</div><div>8 Conduct evaluation</div></div><div><div>INTEGRATION OF GEOSPATIAL DATA AND STATISTICS, e.g.</div><div>Integrate by unique identifiers or other links</div><div>Make derived classifications</div><div>Create new information, prepare and finalise outputs</div><div>Produce WFS/WMS, thematic maps, tables, graphs</div><div>Evaluate usability</div></div><div><div>Statistics</div><div><div>1-3 Plan the process</div><div>4 Collect statistical source data with or without spatiality</div><div>5 Classify, code, calculate aggregates</div><div>6 Create compilation of statistics, prepare and finalise outputs</div><div>7 Store warehouse data, disseminate spatial statistics</div><div>8 Conduct evaluation</div></div></div></div>
		Processing spatial information - a subprocess	(4.1-5.8)	Map data (Point and polygon features)	
X	Are we using statistical data				
		No			
		Accessing geospatial data/ Selection of geospatial data	(5.1)	Selection of geospatial data from a database, a disc or a file geodatabase	Selection of geospatial data to be published Geospatial datasets with topography on a disc / geospatial datasets by gis-formats on a disc
		Yes			
		Selection of attribute data	(5.1)	Point-based/Unit level attribute data	Formalizing access to data warehouse Access to database and datasets available
		Aggregation by area codes/information	(5.7)	Access to database and datasets available	Statistical information processed and classified according to definitions Statistical datasets aggregated and compiled to database tables
		Storing stat. tables	(5.8)	Statistical data aggregated to database tables	Storing statistical tables Aggregated statistical tables extracted from unit level data
		Integration of statistical and geospatial data	(5.1)	Aggregated statistical tables extracted from unit level data <i>and Geospatial datasets with topography on a disc / geospatial datasets by gis-formats on a disc</i>	Integration of statistical and geospatial data Spatial statistical dataset
		Data protection if needed	(6.4)	Spatial statistical dataset	Recording/modifying dataset according to confidentiality rules Spatial statistical dataset
		Recording integrated data to spatial data	(5.8)	Spatial statistical dataset	Recording/modifying dataset according to confidentiality rules Spatial dataset available on disc
	Compiling metadata description		(6.5)	Information on geospatial and statistical data content	Compiling metadata description Joint metadata descripti
	Compiling datasets to be published		(6.5)	Spatial statistical or spatial dataset available on disc	Compiling spatial statistical or spatial dataset as predefined Dataset ready for publishing

The sub-processes of production of geospatial statistics placed in the GSBPM

... a way to communicate

Quality Management / Metadata Management							
Specify Needs	Design	Build	Collect	Process	Analyse	Disseminate	Evaluate
1.1 Identify needs	2.1 Design outputs	3.1 Build collection instrument	4.1 Create frame & select sample	5.1 Integrate data	6.1 Prepare draft outputs	7.1 Update output systems	8.1 Gather evaluation inputs
1.2 Consult & confirm needs	2.2 Design variable descriptions	3.2 Build or enhance process components	4.2 Set up collection	5.2 Classify & code	6.2 Validate outputs	7.2 Produce dissemination products	8.2 Conduct evaluation
1.3 Establish output objectives	2.3 Design collection	3.3 Build or enhance dissemination components	4.3 Run collection	5.3 Review & validate	6.3 Interpret & explain outputs	7.3 Manage release of dissemination products	8.3 Agree an action plan
1.4 Identify concepts	2.4 Design frame & sample	3.4 Configure workflows	4.4 Finalise collection	5.4 Edit & impute	6.4 Apply disclosure control	7.4 Promote dissemination products	
1.5 Check data availability	2.5 Design processing & analysis	3.5 Test production system		5.5 Derive new variables & units	6.5 Finalise outputs	7.5 Manage user support	
1.6 Prepare business case	2.6 Design production systems & workflow	3.6 Test statistical business process		5.6 Calculate weights			
		3.7 Finalise production system		5.7 Calculate aggregates			
				5.8 Finalise data files			

Stat Fi findings

- The GSBPM seems to be able to cover geospatial related statistical production – however,
- Use of descriptions of the GSBPM requires raising the level of abstraction when interpreting phases - a risk from the coherence point of view

→ Our opinion is that the GSBPM model does *not* need new sub-processes for covering geospatiality but the documentation needs to have a broader scope

A suggestion of further work after the Finnish contribution

- 1. Study the national processes of spatial statistics,
Finland + *other countries***
2. Recognise mutual phases
3. Identify and agree mutual phases against the GSBPM model
4. First ideas of items that should be included in the GSBPM
descriptions
5. Evaluate draft additional texts with other interested parts
6. Study the potentials of other descriptive methods (e.g. GSIM)

How to run the same kind work at other NSOs

- A workshop...
- "10 steps" instructions ...
- Several telemeetings...

→ ***What the difficulties tell us?***

- The GSBPM is on its adaption phase
- It has not been used for geospatial related processes
- The level of in-house support rises as an important factor in testing

A suggestion of further work after the Finnish contribution

- 1. Study the national processes of spatial statistics,
Finland + *other countries***
2. Recognise mutual phases
3. Identify and agree mutual phases against the GSBPM model
4. First ideas of items that should be included in the GSBPM
descriptions
5. Evaluate draft additional texts with other interested parts
6. Study the potentials of other descriptive methods (e.g. GSIM)

Hopefully later

In-house support - *Maturity* of applying the GSBPM

1. The right persons were found, discussion was fruitful, support promoted the work
2. The right persons were found, discussion was partly fruitful but practical results were missing, applying of the GSBPM seemed to be too large workload
3. The GSBPM experts were found but no proper benefits of discussions, no support for the applying
4. The project member could not find support for the work

In Statistics Finland

- 3 members of the project group
- Additional geospatial expert
- GSBPM expert

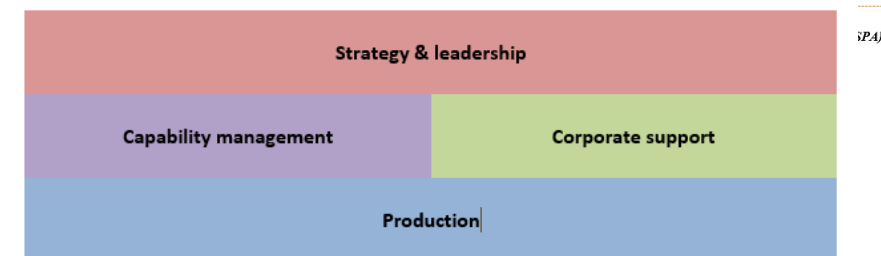

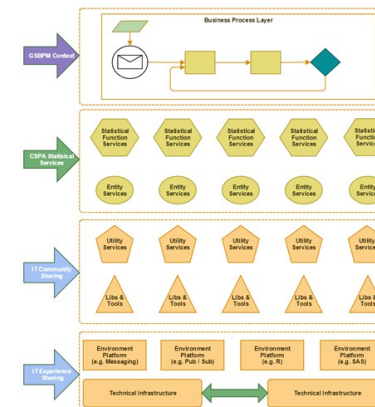

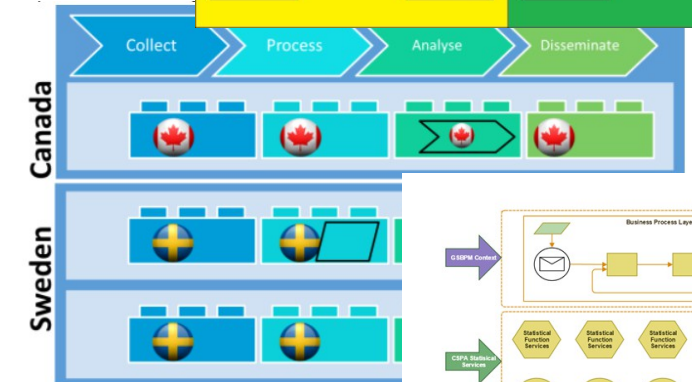

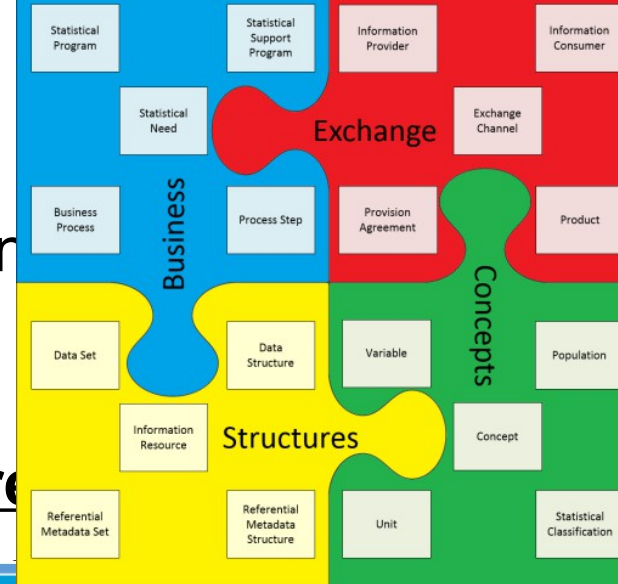

Further work, the GSBPM

- For managing geospatial dimension - a common view is needed
 - For that, more experiences still needed
 - No easy ways: applying requires to understand geospatial processes in organisations
 - For statisticians point of view important is to have a *common understanding* (in own organisation or in international context)

Further work, the other models

- The GSIM, Generic Statistical Information Model for standardisation work
 - Are geospatial elements included?
- The CSPA, Common Statistical Production Architecture for supporting coherency, for service-based production
 - What the services are and from which GSIM elements they are constructed ?
 - From geospatial point of view: e.g. geocoding, services to run geospatial analysis,...
- GAMSO, Generic Activity Model for Statistical Organisations for an organisational view
 - An organisational view **also** for geospatially related *strategical objectives*

Conclusions

- The GSGF into ESGF (Geostat 3), the reference frameworks give a structure to focus the developing (by a consistently way in different levels)
- The models are definitely the right way to indicate the geospatial parts of the statistical production processes
 - For a common view new implementing projects are needed
- The models and their documentations should cover the geospatial dimension
- Support for implementation: a gap between the developers of the models and the geospatial statisticians (who wish to apply)
 - Is the community that develops the models focusing only on *abstract and theoretical aspects* more than *supporting the implementation* of the models? Do we need an intermediate actors in between?

Thank You!
