# A Room with a View or Rear Window? Hedonic prices of the Parisian real-estate. 

Mathilde Poulhès

SOeS (MEEM), Sciences-Po, Insee, Crest (Paris)

EFGS Conference November 17 ${ }^{\text {th }}, 2016$

## Motivations

- Within a small area, real-estate prices experience large variations: the price per square meter of flats sold in Paris ( $105 \mathrm{~km}^{2}$ ) in 2008 varied by a factor of two
- Goal of hedonic models: explain individual choices and prices by the differentiation of the goods
- Real-estate: intrinsic characteristics but also localization, neighbourhood quality, job accessibility, amenities, etc.

## What are the prices of extrinsic housing characteristics?

## Contribution

- Estimation of the implicit prices using the discontinuity designs using administrative boundaries when it is possible and very local fixed effects when it is not.
- Unique dataset about neighbourhood attributes: use of geocoded data
- Simultaneous estimations in order to directly compare the valuations for the different neighbourhood attributes
- We show that spatial correlation disappears when we include enough data to describe the housing environment

## Hedonic prices interpretation

Question: How much a buyer of a flat located in a very noisy neighborhood is willing to pay for a reduction of ten decibels down?

- Around the equilibrium
- Prices of the different characteristics
- Indication of the variation of utility of the buyers when a characteristic experiences a marginal change

Question: What is the impact on the price of the global reduction of noise in Paris ?

- To go further:
- the characteristics of the buyers and their income
- identification hypothesis, see Ekeland et al. (2004)

## Empirical analysis

## Application to the Parisian real-estate

Table: Descriptive statistics of the sample

|  | Price per square meter | Surface | Number of rooms | Number of transactions |
| :--- | :---: | :---: | :---: | :---: |
| 2008 | 6639.79 | 50.84 | 2.4 | 18,803 |
| 2009 | $(1929.7)$ | $(36.45)$ | $(1.3)$ |  |
|  | 6351.79 | 51.82 | 2.43 | 16,119 |
| 2010 | $(1822.52)$ | $(35.62)$ | $(1.29)$ | 19,565 |
| Total | 7059.67 | 54.1 | 2.49 |  |
|  | $(1996.08)$ | $(37.87)$ | $(1.32)$ | 54,487 |
|  | 6705.36 | $(1944.67)$ | $(32.3$ | 2.44 |

## Description of the house

- Intrinsic characteristics: surface, number of rooms, number of bathrooms, elevator, floor, terrace, date of construction,...
- Job accessibility
- Access to public transportation network
- Noise
- Crime
- Quality of the assigned public junior high school
- Local amenities
- Neighbourhood characteristics (Census data)
- Fiscal revenue in the close neighbourhood

## Job accessibility by car

Accessibilite de l'emploi (\%)

| $\square$ | $[10,20)$ |
| :--- | :--- |
| $\square$ | $[20,30)$ |
| $\square$ | $[30,40)$ |
| $\square$ | $[40,50)$ |
| $\square$ | $[50,60)$ |
| $\square$ | $[60,70)$ |
| $\square$ | $[70,80]$ |

Figure: Percentage of jobs located in Ile-de-France accessible in less than 30 minutes car drive (Driea, Insee (CLAP))

## Job accessibility by public transportation

Figure: Percentage of jobs located in Ile-de-France accessible in less than 30 minutes in PT (Driea, Insee (CLAP))

## Access to public transportation network

Figure: Minimal distances from the metro (RATP, SNCF)

## Noise

Figure: Night level of noise (en dB), BruitParif

## Crime

Figure: Physical violence density, ONDRP

## Crime: Counting procedure

Figure: Counting procedure of crime

## Quality of the assigned school

Figure: Success rate at the final exam in the Parisian public junior high school zones
Source: Paris City Council, DEPP

## Method

$$
\begin{equation*}
\log (p)=f(S)+\beta_{1} X_{1}+\beta_{2} X_{2}+\mathbb{1}_{L}+\epsilon \tag{1}
\end{equation*}
$$

where

- $S$ is the surface
- $X_{1}$ the intrinsic characteristics of the hosue
- $X_{2}$ the characteristics of the neighbourhood

In some estimations we add:

- $\mathbb{1}_{L}$ a very local dummy

## Local fixed effects

Figure: Parisian administrative districts
Notes: Continuous boundaries correspond to the limits of the arrondissements, dotted lines correspond to the limits of the grands quartiers and dashed lines correspond to the limits of the IRIS. In the blue box, we focus on the VIème arrondissement.

## Results: explained variance

Table: Variance explained by the different groups of characteristics

| Estimator | Without Fixed Effects |  |  | IRIS Fixed Effects |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Variables | Surface $\log$ (price) <br> (1) | House Char $\log$ (price) (2) | Neigh. Char. $\log$ (price) <br> (3) | Surface $\log ($ price $)$ <br> (4) | House Char. $\log$ (price) (5) | Neigh. Char. $\log$ (price) <br> (6) |
| $R^{2}$ explained variance | 0.850 | 0.866 | 0.912 | 0.908 | 0.922 | 0.923 |
| $R^{2}$ adjusted | 0.850 | 0.866 | 0.912 | 0.906 | 0.921 | 0.921 |
| Surface (polynomial) | Yes | Yes | Yes | Yes | Yes | Yes |
| Years and months | Yes | Yes | Yes | Yes | Yes | Yes |
| House characteristics | No | Yes | Yes | No | Yes | Yes |
| Neighborhood characteristics | No | No | Yes | No | No | Yes |
| Number of observations | 54395 | 54395 | 54395 | 54395 | 54395 | 54395 |

Standard errors in parentheses
${ }^{*} \mathrm{p}<0.10 .{ }^{* *} \mathrm{p}<0.05$. $^{* * *} \mathrm{p}<0.010$

## Results: surface

Figure: Hedonic price of the surface

## Results: magnitude of the effects

| Variable | Standard deviation of the variable | $\Delta X$ | Effect in price \% |
| :---: | :---: | :---: | :---: |
| Surface | 36.5 | +1 m ${ }^{2}$ | 1.1\% |
| Floor | 2.94 | $2^{\text {d }}$ vs Floor | 7.5\% |
| Elevator | - | Yes vs No | $2.1 \%$ |
| Job accessibility PPlus | 16.74 \% | +16.74 \% | 2.2 \% |
| Transport accessibility $\triangle$ Plus | 122 m | 500 m vs 378 m | -0.01\% |
| Noise PPlus | - | More than 65 dB vs Less than 50 dB | -0.01 \% |
| Crime (100m) PPlut | 63.5 | +63.5 infractions | -0.03 \% |
| School quality Plut | 9.34 \% | +9.34\% of success | 1.04 \% |

## Results: a Room with a View

Table: Influence of the type of streets

Standard errors in parentheses

$$
* \mathrm{p}<0.10, * * \mathrm{p}<0.05, * * * \mathrm{p}<0.010
$$

## Spatial correlation

Table: Spatial correlation indexes

|  | Prices | Residuals 1 | Residuals 2 | Residuals 3 |
| :--- | :---: | :---: | :---: | :---: |
| Moran index | 0.167 | 0.275 | 0.079 | 0.001 |
| p.value of Moran's test | 0.000 | 0.000 | 0.000 | 0.709 |
| Mantel index | 0.048 | 0.059 | -0.002 | -0.014 |
| p.value of Mantel's test | 0.005 | 0.005 | 0.687 | 0.960 |
| House characteristics | No | Yes | Yes | Yes |
| Neighbourhood characteristics | No | No | Yes | Yes |
| Fixed effects | No | No | No | Yes |

Notes: The p-values correspond to the test of the presence of spatial correlation in the data.

## Spatial correlation

Figure: Spatial distribution of prices (in log)

## Spatial correlation

Figure: Spatial distribution des résidus (regression on the intrinsic characteristics of the house)

## Spatial correlation

Figure: Spatial distribution des résidus (regression on the intrinsic and extrinsic characteristics of the house)

## Spatial correlation

Figure: Spatial distribution of the residuals (regression on the intrinsic and extrinsic characteristics of the house with local fixed effects)

## Conclusion

- Significant and substantial influence of some neighbourhood characteristics on real-estate price:
- better assigned school
- accessibility of jobs
- Significant but small influence of others:
- crime
- Work in progress
- match the transaction file with fiscal files to obtain the fiscal income of the buyers
- estimate the demand parameters

## Results: job accessibility

Table: Hedonic price of job accessibility

| Estimator | Without Fixed Effects |  | Grand-quartier Fixed Effects |  |
| :---: | :---: | :---: | :---: | :---: |
| Variables | $\log$ (price) <br> (1) | $\log$ (price) <br> (2) | $\log \text { (price) }$ <br> (3) | $\log$ (price) <br> (4) |
