

Nordic Forum for Geostatistics 2007

(paper/presentation):

Trine Haagenen, Statistics Norway: Small area index mapping and analysis

(Session 2)

Statistics Norway has in cooperation with Institute for Transport Economics developed techniques for displaying geostatistics at neighbourhood level. In 2005 a project was started up, funded by the Directorate for Health. Confidentiality rules for the technique were approved in 2006. In 2007 the neighbourhood model was used on indicators for income, demography and ethnicity. Maps have been made for Oslo urban areas within Oslo municipality, showing status and timelines.
