

Green Slovenian Location Framework for connected NSDI

Matej Sotlar, Surveying and Mapping Authority of the Republic of Slovenia

Abstract:

The main aim of the Green Slovenian Location Framework project is establishing horizontal digital connectivity between spaces, environment, real estate, water and nature in order to enable intelligent use of space, reduce the construction on greenfield sites and thus increase resistance to climate change. The project will create a horizontal connection between information systems to unlock the significant potential of connected processes and data so as to support the priority actions of the European Green Deal in the areas of climate change, circular economy, zero pollution, biodiversity, and ensuring compliance with the Union acquis.
