

Rules, techniques and processes to design the enumeration areas to collect and disseminate Italian census data

Mrs Pina Grazia Ticca, ISTAT, Italy

Abstract

The presentation illustrates the techniques to design the enumeration areas (EA) to collect the census data. The process is based on an update of the previous census EAs on top of images and local cartography, especially focused on urban areas, rather than in rural areas. The EAs are based on administrative boundaries and the updating rules are oriented to maintain the comparability with the previous censuses, where possible, and to follow the UNECE recommendations on urban areas. The dissemination of the census results is based on the same enumeration areas and on the local administrative areas.
